WAVE THEORY, SOUND WAVES AND DOPPLER'S EFFECTS

1. WAVE AND ITS CHARACTERISTICS

1.1 Introduction of Waves

What is wave motion?

- When a particle moves through space, it carries KE with itself. Wherever the particle goes, the energy goes with it. (One way of transport energy from one place to another place).
- There is another way (wave motion) to transport energy from one part of space to other without any bulk motion of material together with it. Sound is transmitted in air in this manner.
 - Ex. You (in Kota) want to communicate your friend (in Delhi)

 1^{st} option involves the concept of particle & the second choice involves the concept of wave.

Ex. When you say "Namaste" to your friend no material particle is ejected from your lips to fall on your friends ear. Basically you create some disturbance in the part of the air close to your lips. Energy is transferred to these air particles either by pushing them ahead or pulling them back. The density of the air in this part temporarily increases or decreases. These disturbed particles exert force on the next layer of air, transferring the disturbance to that layer. In this way, the disturbance proceeds in air and finally the air near the ear of the listener gets disturbed.

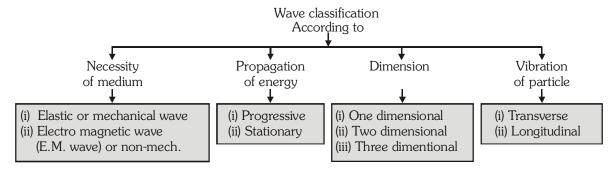

Note: In the above example air itself does not move.

A **wave** is a disturbance that propagates in space, transports energy and momentum from one point to another without the transport of matter.

Few examples of waves:

The ripples on a pond (water waves), the sound we hear, visible light, radio and TV signals etc.

1.2 Classification of waves

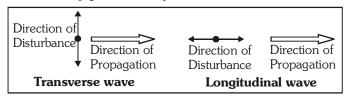

(i) Based on medium necessity: A wave may or may not require a medium for its propagation. The waves which do not require medium for their propagation are called non-mechanical, e.g. light, heat (infrared), radio waves etc. On the other hand the waves which require medium for their propagation are called mechanical waves. In the propagation of mechanical waves elasticity and density of the medium play an important role therefore mechanical waves are also known as elastic waves.

Example: Sound waves in water, seismic waves in earth's crust.

- **(ii) Based on energy propagation :-** Waves can be divided into two parts on the basis of energy propagation (i) Progressive wave (ii) Stationary waves. The progressive wave propagates with constant velocity in a medium. In stationary waves particles of the medium vibrate with different amplitude but energy does not propagate.
- (iii) Based on direction of propagation: Waves can be one, two or three dimensional according to the number of dimensions in which they propagate energy. Waves moving along strings are one-dimensional. Surface waves or ripples on water are two dimensional, while sound or light waves from a point source are three dimensional.
- (iv) Based on the motion of particles of medium:

Waves are of two types on the basis of motion of particles of the medium.

- (i) Longitudinal waves
- (ii) Transverse waves

In the transverse wave the direction associated with the disturbance (i.e. motion of particles of the medium) is at right angle to the direction of propagation of wave while in the longitudinal wave the direction of disturbance is along the direction of propagation.

1.3 Transverse Wave Motion

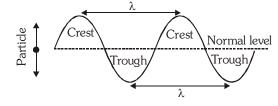

Mechanical transverse waves are produced in such type of medium which have shearing property, so they are known as shear wave or S-wave

Note: Shearing is the property of a body by which it changes its shape on application of force.

⇒ Mechanical transverse waves are generated only in solids and surface of liquid.

Individual particles of the medium execute

SHM about their mean position in direction perpendicular to the direction of propagation of wave.

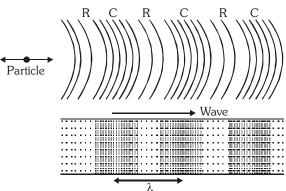

A **crest** is a portion of the medium, which is raised temporarily above the normal position of rest of particles of the medium, when a transverse wave passes.

A **trough** is a portion of the medium, which is depressed temporarily below the normal position of rest of particles of the medium, when a transverse wave passes.

1.4 Longitudinal Wave Motion

In this type of waves, oscillatory motion of the medium particles produces regions of compression (high pressure) and rarefaction (low pressure) which propagated in space with time (see figure).

Note: The regions of high particle density are called compressions and regions of low particle density are called rarefactions.

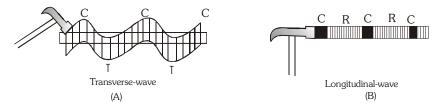

The propagation of sound waves in air is visualized as the propagation of pressure or density fluctuations. The pressure fluctuations are of the order of 1 Pa, whereas atmospheric pressure is $10^5 Pa$.

1.5 Mechanical Waves in Different Media

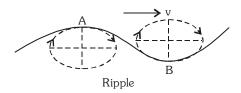

- A mechanical wave will be transverse or longitudinal depending on the nature of medium and mode of excitation.
- In strings, mechanical waves are always transverse when string is under a tension. In the bulk of gases and liquids mechanical waves are always longitudinal e.g. sound waves in air or water. This is because fluids cannot sustain shear.
- In solids, mechanical waves (may be sound) can be either transverse or longitudinal depending on the mode of excitation. The speed of the two waves in the same solid are different. (Longitudinal waves travels faster than transverse waves). e.g., if we struck a rod at an angle as shown in fig. (A) the waves in the rod will be transverse while if the rod is struck at the side as shown in fig. (B) or is rubbed with a cloth the waves in the rod will be longitudinal. In case of vibrating tuning fork waves in the prongs are transverse while in the stem are longitudinal.

Further more in case of seismic waves produced by Earthquakes both S (shear) and P (pressure) waves are produced simultaneously which travel through the rock in the crust at different speeds

 $[v_s \cong 5 \text{ km/s while } v_p \cong 9 \text{ km/s}]$ S-waves are transverse while P-waves are longitudinal.

Some waves in nature are neither transverse nor longitudinal but a combination of the two. These waves are called 'ripple' and waves on the surface of a liquid are of this type. In these waves particles of the medium vibrate up and down and back and forth simultaneously describing ellipses in a vertical plane.

1.6 Characteristics of wave motion

- In wave motion, the disturbance travels through the medium due to repeated periodic oscillations of the particles of the medium about their mean positions.
- The energy is transferred from one place to another without any actual transfer of the particles of the medium.
- Each particle receives disturbance a little later than its preceding particle i.e., there is a regular phase difference between one particle and the next.
- The velocity with which a wave travels is different from the velocity of the particles with which they vibrate about their mean positions.
- The wave velocity remains constant in a given medium while the particle velocity changes continuously during its vibration about the mean position. It is maximum at mean position and zero at extreme position.
- For the propagation of a mechanical wave, the medium must possess the properties of inertia, elasticity and minimum friction among its particles.

9810934436, 8076575278, 8700391727

1.7 Some important terms connected with wave motion

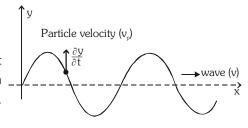

Wavelength (λ) [length of one wave]

Distance travelled by the wave during the time interval in which any one particle of the medium completes one cycle about its mean position. We may also define wavelength as the distance between any two nearest particles of the medium, vibrating in the same phase.

- **Frequency (n)**: Number of cycle (number of complete wavelengths) completed by a particle in unit time.
- **Time period (T)**: Time taken by wave to travel a distance equal to one wavelength.
- **Amplitude (A)**: Maximum displacement of vibrating particle from its equilibrium position.
- Angular frequency (ω): It is defined as $\omega = \frac{2\pi}{T} = 2\pi n$
- **Phase :** Phase is a quantity which contains all information related to any vibrating particle in a wave. For equation $y = A \sin(\omega t kx)$; $(\omega t kx) = phase$.
- Angular wave number or propagation constant (k) : It is defined as $k = \frac{2\pi}{\lambda}$
- Wave number (\overline{v}): It is defined as $\overline{v} = \frac{1}{\lambda} = \frac{k}{2\pi} = \text{number of waves in unit length of the wave pattern.}$
- Particle velocity, wave velocity and particle's acceleration: In plane progressive harmonic wave particles of the medium oscillate simple harmonically about their mean position. Therefore, all the formulae that we studied in SHM apply to the particles here also. For example, maximum particle velocity is $\pm A\omega$ at mean position and it is zero at extreme positions. Similarly maximum particle acceleration is $\pm \omega^2 A$ at extreme positions and zero at mean position. However the wave velocity is different from the particle velocity. This depends on certain characteristics of the medium. Unlike the particle velocity which oscillates simple harmonically (between $+ A\omega$ and $A\omega$) the wave velocity is constant for given characteristics of the medium.

• Particle velocity in wave motion :

The individual particles which make up the medium do not travel through the medium with the waves. They simply oscillate about their equilibrium positions. The instantaneous velocity of an oscillating particle of the medium, through which a wave is travelling, is known as "particle velocity".

4

Wave velocity: The velocity with which the disturbance, or planes
of equal phase (wave front), travel through the medium is called wave (or phase) velocity.

• Relation between particle velocity and wave velocity:

Wave equation :- $y = A \sin(\omega t - kx)$, Particle velocity $v_p = \frac{\partial y}{\partial t} = A\omega\cos(\omega t - kx)$.

Wave velocity =
$$V = \frac{\lambda}{T} = \lambda \frac{\omega}{2\pi} = \frac{\omega}{k}$$
, $\frac{\partial y}{\partial x} = -Ak \cos(\omega t - kx) = -\frac{A}{\omega}\omega k \cos(\omega t - kx) = -\frac{1}{V}\frac{\partial y}{\partial t} \Rightarrow \boxed{\frac{\partial y}{\partial x} = -\frac{1}{V}\frac{\partial y}{\partial t}}$

Note: $\frac{\partial y}{\partial x}$ represents the slope of the string (wave) at the point x.

Particle velocity at a given position and time is equal to negative of the product of wave velocity with slope of the wave at that point at that instant.

• Particle velocity (v_n) and acceleration (a_n) in a sinusoidal wave :

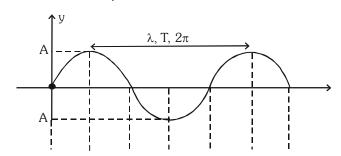

The acceleration of the particle is the second partial derivative of y(x, t) with respect to t,

$$\therefore \ a_P = \frac{\partial^2 y(x,t)}{\partial t^2} = -\omega^2 A \sin(\omega t - kx) = -\omega^2 y(x,t)$$

i.e., the acceleration of the particle equals $-\omega^2$ times its displacement, which is the same result we obtained for SHM. Thus, $a_p = -\omega^2$ (displacement)

Relation between Phase difference, Path difference & Time difference

Phase difference (Δφ)	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$	2π	$\frac{5\pi}{2}$	3π
Path difference (Δλ)	0	$rac{\lambda}{4}$	$\frac{\lambda}{2}$	$\frac{3\lambda}{4}$	λ	$\frac{5\lambda}{4}$	$\frac{3\lambda}{2}$
Time difference (Δt)	0	<u>T</u>	<u>T</u> 2	3T 4	Т	5T 4	3T 2

$$\Rightarrow \frac{\Delta \varphi}{2\pi} = \frac{\Delta \lambda}{\lambda} = \frac{\Delta t}{T} \Rightarrow \text{Path difference} = \left(\frac{\lambda}{2\pi}\right) \text{ Phase difference}$$

GOLDEN KEY POINTS

- A wave motion is a kind of disturbance which travels through a medium due to repeated periodic motion of the particles of the medium about their mean position, the motion being transferred continuously from particle to particle.
- Mechanical waves transmit energy but not the matter.
- The transmission of energy is possible due to two properties of the medium, the elasticity and the inertia.
- Material medium is necessary for the propagation of mechanical waves:
- If we generate waves in a medium continuosly, the particles of the medium oscillate continuosly. In this situation, the disturbance produced in the medium is called a progressive wave.
- When a progressive waves propagates in a medium, then, at any instant all the particles of the medium oscillate in the same way but the phase of oscillation changes from particle to particle.
- Equation of a plane progressive simple harmonic wave : $y = a \sin \frac{2\pi}{\lambda} (Vt x) = a \sin 2\pi \left(\frac{t}{T} \frac{x}{\lambda}\right)$

Where V is the velocity of wave, λ is the wavelength of wave, a is the amplitude of the oscillation of particles of the medium and y is the instantaneous displacement of the particle located at x at instant t.

Phase difference between two medium particle having a path difference $\Delta\lambda$ is :

$$\Delta \phi = \frac{2\pi}{\lambda} \times \Delta \lambda \qquad \text{If } \Delta \lambda = \lambda$$

If
$$\Delta \lambda = \lambda$$

Then
$$\Delta \phi = 2\pi$$

• Also
$$\Delta \phi = \frac{2\pi}{T} \times \Delta t$$
 If $\Delta t = T$

If
$$\Delta t = T$$

Then
$$\Delta \phi = 2\pi$$

That is after one time period the phase of oscillation of a particle becomes the same as in the begining.

Illustrations

Illustration 1.

Given below are some examples of wave motion. State in each case the wave motion is transverse, longitudinal or a combination of both :

- (a) Motion of kink in a long coil spring produced by displacing one end of the spring side ways.
- (b) Waves produced in a cylinder containing a liquid by moving its piston back and forth.
- (c) Waves produced by a motorboat sailing in water.
- (d) Ultrasonic waves in air produced by a vibrating quartz crystal.

Solution

- (a) Transverse and longitudinal (b) Longitudinal
- (c) Transverse and longitudinal (d) Longitudinal

Illustration 2.

A progressive wave of frequency $500 \, \text{Hz}$ is travelling with a velocity of $360 \, \text{m/s}$. How far apart are two points 60° out of phase.

Solution

We know that for a wave
$$v=f~\lambda~$$
 So $\lambda=\frac{v}{f}=\frac{360}{500}$ = 0.72 m

Phase difference
$$\Delta \phi = 60^{\circ} = (\pi/180) \times 60 = (\pi/3) \text{ rad}$$
,

so path difference
$$\Delta \lambda = \frac{\lambda}{2\pi} (\Delta \phi) = \frac{0.72}{2\pi} \times \frac{\pi}{3} = 0.12 \text{ m}$$

Illustration 3.

On the average a human heart is found to beat 75 times in a minute. Calculate its beat frequency of heart and period.

Solution

The beat frequency of heart =
$$\frac{75}{60}$$
 = 1.25 = 1.25 Hz

The time period T =
$$\frac{1}{1.25}$$
 = 0.8 s.

Illustration 4.

A man generates a symmetrical pulse in a string by moving his hand up and down. At t = 0 the point in his hand moves downward. The pulse travels with speed of 3 m/s on the string & his hands passes 6 times in each second from the mean position. Then the point on the string at a distance 3m will reach its upper extreme first time at time t = 0

(1) 1.25 sec. (2) 1 sec (3)
$$\frac{13}{12}$$
 sec (4) none

Solution Ans. (1)

Frequency of wave
$$=\frac{6}{2}=3 \Rightarrow T=\frac{1}{3}s$$
; $\lambda=VT=(3)\left(\frac{1}{3}\right)=1m$

Total time taken =
$$\frac{3}{3} + \frac{3T}{4} = 1.25$$
 sec

BEGINNER'S BOX-1

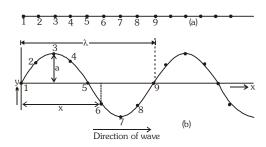

- 1. A wave has a speed of 300 m/sec and frequency 500 Hz. The phase difference between two adjacent points is $\pi/3$ radian. What will be the path difference between them ?
- **2.** A stone dropped from the top of a tower of height 300 m high splashes into the water of a pond near the base of the tower. When is the splash heard at the top, given that the speed of sound in air is 340 m s⁻¹? ($g = 9.8 \text{ ms}^{-2}$)

2. PROGRESSIVE WAVE ON STRING

2.1 Equation of a Plane Progressive Wave

If, during propagation of wave in a medium, the particles of the medium perform simple harmonic motion then the wave is called a 'simple harmonic progressive wave'. Suppose, a simple harmonic progressive wave is propagating in a medium along the positive direction of the x-axis (from left to right). In fig. (a) the equilibrium positions of the particles $1, 2, 3 \dots$ are shown.

When the wave propagates, these particles oscillate about

their equilibrium positions. In Fig. (b) the instantaneous positions of these particles at a particular instant are shown. The curve joining these positions represents the wave. Let the time be counted from the instant when the particle 1 situated at the origin starts oscillating. If y be the displacement of this particle after t seconds, then $y = a \sin \omega t$...(i)

where a is the amplitude of oscillation and $\omega=2\pi$ n, where n is the frequency. As the wave reaches the particles beyond the particle 1, the particles start oscillating. If the speed of the wave be v, then it will reach particle 6, distant x from the particle 1, in x/v sec. Therefore, the particle 6 will start oscillating x/v sec after the particle 1. It means that the displacement of the particle 6 at a time t will be the same as that of the particle 1 at a time x/v sec earlier i.e. at time t – (x/v). The displacement of particle 1 at time t – (x/v) is equal to particle 6, distant x from the origin (particle 1), at time t which is given by

$$y = a \sin \omega \, \left(t - \frac{x}{V} \right) \hspace{1cm} \text{But } \omega = 2\pi \, n, \, y = a \sin \left(\omega t - kx \right) \hspace{0.5cm} \left(k = \frac{\omega}{V} \right) \hspace{0.5cm} ... \text{(ii)}$$

$$y = a \sin \left[\frac{2\pi}{T} t - \frac{2\pi}{\lambda} x \right] \qquad \text{Also } k = \frac{2\pi}{\lambda} \dots \text{(iii)} \qquad y = a \sin 2\pi \left[\frac{t}{T} - \frac{x}{\lambda} \right] \dots \text{(iv)}$$

This is the equation of a simple harmonic wave travelling along +x direction. If the wave is travelling along the -x direction, then there will be plus sign instead of minus sign inside the brackets in the above equations. For example, equation (iv) will be of the following form : $y = a \sin 2\pi \left(\frac{t}{T} + \frac{x}{\lambda}\right)$. If ϕ be the initial phase difference between the above wave travelling along +x direction and an other wave, then the equation of other wave will be

$$y = a \sin \left\{ 2\pi \left(\frac{t}{T} - \frac{x}{\lambda} \right) \pm \phi \right\}$$

2.2 Velocity of Transverse Mechanical Waves

Velocity of a transverse wave propagating along a string having tension T and mass per unit length m, is given by $V=\sqrt{\frac{T}{m}}$

If D is the diameter of the string, ℓ is its length and ρ is its density, then

$$\Rightarrow \qquad m = \frac{\pi \bigg(\frac{D}{2}\bigg)^2 \, \ell \rho}{\ell} = \frac{\pi D^2 \rho}{4} \qquad \Rightarrow \qquad V = \sqrt{\frac{T}{\pi D^2}} = \frac{2}{D} \sqrt{\frac{T}{\pi \rho}}$$

Wave always travel with respect to medium (not w.r.t. ground). Therefore any expression derived for the velocity of wave always gives velocity w.r.t. medium not w.r.t. ground.

2.3 Intensity of Waves:

When waves incident perpendicularly on an imaginary surface (wavefront) then the max. energy of waves per unit area, per unit time is known as intensity of waves.

$$I = \frac{1}{2}\rho w^2 A^2 v \qquad \frac{w}{m^2} \text{ or } \frac{J}{s - m^2}$$

when medium is fixed then $\boxed{I \propto w^2 A^2}$

Wave front → An imaginary surface on which waves incident perpendicular & in same phase.

Wave front	Plane	Spherical	Cylindrical
Source	Source at infinite distance	Point source	Linear source
	Sun, Torch,	(Bulb, small siren)	(tubelight)
	loud speaker		
Area of	$A = \ell \times b$	$A = 4\pi r^2$	$A = 2\pi rl$
wavefront	A = const.	$A \propto r^2$	$A \propto r$
$I \propto \frac{1}{\text{Area}} \propto a^2$	I = constant	$I \propto \frac{1}{r^2} \propto a^2$	$I \propto \frac{1}{r} \propto a^2$
Variation during	a = constant	$a \propto \frac{1}{r}$	$a \propto \frac{1}{\sqrt{r}}$
propagation			
Equation	$y = a \sin(\omega t - kx)$	$y = \frac{c}{r} \sin(\omega t - kr)$	$y = \frac{c'}{\sqrt{r}} \sin(\omega t - kr)$
	Plane progressive	Spherical progressive	Cylindrical progressive
	wave	wave	wave

GOLDEN KEY POINTS

- Equation $y = a \sin(\omega t kx)$ represents displacement of all medium particles at any time 't', in other words it can give us displacement of any specific particle at each and every time so it is called as equation of progressive wave.
- Negative sign between ωt and kx indicates that direction of propagation is positive.
- Positive sign between ωt and kx indicates that direction of propagation is negative.

- For a plane progressive wave $y = a \sin(\omega t kx)$ producing transverse vibration show that $\frac{\partial y}{\partial x} = -\frac{1}{V} \times \frac{\partial y}{\partial t}$ i.e. velocity of particle at a given point = (-) wave velocity×slope of wave at that point. (Slope of wave is also called as wave strain) and $\frac{\partial^2 y}{\partial x^2} = \frac{1}{V^2} \frac{\partial^2 y}{\partial t^2}$ is known as differential equation of wave motion.
- Differential equation of harmonic progressive waves :

$$\frac{\partial^2 y}{\partial t^2} = -A\omega^2 \sin(\omega t - kx) \Rightarrow \frac{\partial^2 y}{\partial x^2} = -Ak^2 \sin(\omega t - kx) \Rightarrow \frac{\partial^2 y}{\partial x^2} = \frac{1}{V^2} \frac{\partial^2 y}{\partial t^2}$$

- Relations :- $\omega = 2\pi n$, $V = n\lambda$, $k = \frac{2\pi}{\lambda}$, $\omega = Vk$
- Intensity of wave (I):-

$$I = 2\pi^2 n^2 a^2 V \rho$$

 $\rho \rightarrow$ density of medium

For Interference $\rightarrow I \propto a^2$

For Beats $\rightarrow I \propto n^2 a^2$

Energy density (U): - Maximum wave energy per unit volume of medium

$$U = \frac{E_{\text{max}}}{\text{vol}} = \frac{\frac{1}{2}Mv_{\text{max}}^2}{\text{vol}} = \frac{\frac{1}{2}\text{vol} \times \rho \times v_{\text{max}}^2}{\text{vol}} = 2\pi^2 n^2 a^2 \rho \quad \Rightarrow \quad I = V \times U$$

Illustrations

Illustration 5.

The equation of a wave is, $y(x,t) = 0.05 \sin \left[\frac{\pi}{2} (10x - 40t) - \frac{\pi}{4} \right] m$

- **Find:** (a) The wavelength, the frequency and the wave velocity
 - (b) The particle velocity and acceleration at x=0.5 m and t=0.05 s.

Solution

(a) The equation may be rewritten as, $y(x,t) = 0.05 \sin \left(5\pi x - 20\pi t - \frac{\pi}{4} \right) m$

Comparing this with equation of plane progressive harmonic wave,

$$y(x, t) = A \sin(kx - \omega t + \phi)$$
 we have,

wave number
$$k = \frac{2\pi}{\lambda} = 5\pi rad/m$$
 $\therefore \lambda = 0.4m$

The angular frequency is, $\omega = 2\pi f = 20\pi \, \text{rad/s}$ $\therefore f = 10 \, \text{Hz}$

The wave velocity is,

$$V=f \ \lambda = \frac{\omega}{k} = 4ms^{-1} \ in + x \ direction$$

(b) The particle velocity and acceleration are,

$$v_{p} = \frac{\partial y}{\partial t} = -(20\pi)(0.05)\cos\left(\frac{5\pi}{2} - \pi - \frac{\pi}{4}\right) = 2.22\text{m/s}$$

$$a_p = \frac{\partial^2 y}{\partial t^2} = -(20\pi)^2 (0.05) \sin\left(\frac{5\pi}{2} - \pi - \frac{\pi}{4}\right) = 140 \text{ m/s}^2$$

Illustration 6.

For the travelling harmonic wave $y(x, t) = 2 \cos 2\pi (10t - 0.0080 x + 0.35)$

where x and y are in cm and t in s. Calculate the phase difference between oscillatory motion of two points separated by a distance of

(a) 4m

- (b) 0.5m
- (c) half of wavelength
- (d) Third fourth of the wavelength

Solution

Given equation $y = 2 \cos 2\pi (10t - 0.008x + 0.35) = 2 \cos (20\pi t - 0.016 \pi x + 0.7 \pi)$ compare with standard equation $y = a \cos (\omega t - kx + \phi)$

$$k = 0.016\pi \text{ cm}^{-1}, \ \omega = 20\pi \text{ s}^{-1},$$

- (a) When x = 4m = 400 cm then phase difference = $0.016 \pi \times 400 = 6.4 \pi$ rad.
- (b) When x = 0.5m = 50 cm then phase difference $= 0.016\pi \times 50 = 0.8 \pi$ rad.
- (c) When $x = \frac{\lambda}{2}$ then phase difference = $kx = \frac{2\pi}{\lambda} \times \frac{\lambda}{2} = \pi$ rad.
- (d) When $x = \frac{3\lambda}{4}$ then phase difference $= kx = \frac{2\pi}{\lambda} \times \frac{3\lambda}{4} = \frac{3\pi}{2}$ rad.

Illustration 7.

Which of the following functions represent a travelling wave?

(a)
$$(x - vt)^2$$

(b)
$$\ell n(x + vt)$$

(c)
$$e^{-(x-vt)^2}$$

(d)
$$\frac{1}{x + vt}$$

Solution

Although all the four functions are written in the form $f(ax \pm bt)$, only (c) among the four functions is finite everywhere at all times. Hence only (c) represents a travelling wave.

Illustration 8.

A progressive wave having amplitude 5 m and wavelength 3 m. If the maximum average velocity of particle in half time period is 5 m/s and wave is moving in the positive x-direction then find which may be the **correct** equation(s) of the wave? [where x in meter]

$$(1) 5 \sin\left(\frac{2\pi}{5}t - \frac{2\pi}{3}x\right)$$

$$(2) 4\sin\left(\frac{\pi t}{2} - \frac{2\pi}{3}x\right) + 3\cos\left(\frac{\pi t}{2} - \frac{2\pi}{3}x\right)$$

(3)
$$5\sin\left(\frac{\pi t}{2} - \frac{2\pi}{3}x\right)$$

(4)
$$3\cos\left(\frac{2\pi}{5}t - \frac{2\pi}{3}x\right) - 4\sin\left(\frac{2\pi}{5}t - \frac{2\pi}{3}x\right)$$

Solution Ans. (2,3)

$$\therefore \lambda = 3m \quad \therefore k = \frac{2\pi}{\lambda} = \frac{2\pi}{3}$$

Maximum displacement in half time period = 2a = 10 m

So maximum average velocity =
$$\frac{10}{T/2} = 5 \Rightarrow T = 4 \text{ s} \Rightarrow \omega = \frac{2\pi}{T} = \frac{2\pi}{4} = \frac{\pi}{2}$$

Illustration 9.

Two mechanical waves, $y_1 = 2 \sin 2\pi (50 t - 2x) \& y_2 = 4 \sin 2\pi (ax + 100 t)$ propagate in a medium with same speed.

(1) The ratio of their intensities is 1:16

(2) The ratio of their intensities is 1:4

(3) The value of 'a' is 4 units

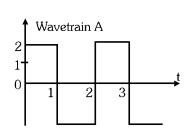

(4) The value of 'a' is 2 units

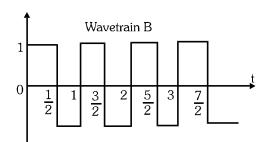

Solution Ans. (1,3)

$$I = \frac{1}{2}\rho\nu\omega^2A^2 \text{ and velocity } = \frac{\omega}{k}$$

Illustration 10.

Calculate the ratio of intensity of wavetrain A to wavetrain B.

Solution

$$\label{eq:large_energy} \because \ I \ \propto a^2 n^2 \ \therefore \ \frac{I_A}{I_B} \ = \ \frac{a_A^2 n_A^2}{a_B^2 n_B^2} \ = \ \left(\frac{2}{1}\right)^2 \ \times \left(\frac{1}{2}\right)^2 \ = \ 1$$

Illustration 11.

A steel wire has a length of 12.0 m and a mass of 2.10 kg. What should be the tension in the wire so that speed of a transverse wave on the wire equals the speed of sound in dry air at 20° C = 343 ms⁻¹.

Solution

$$m = \frac{2.10}{12} = 0.175 \text{ kgm}^{-1} \qquad \because \sqrt{\frac{T}{m}} = 343 \text{ ms}^{-1} \qquad \Rightarrow T = (343)^2 \times 0.175 = 2.06 \times 10^4 \text{ N}$$

BEGINNER'S BOX-2

- 1. A travelling wave in stretched string is given by the equation : $y = 40 \cos(3x 5t)$ cm where t is in sec. Determine the maximum speed of particles of medium.
- 2. The displacement produced by a simple harmonic wave is $y = \frac{10}{\pi} \sin \left(200\pi t \frac{\pi x}{17} \right)$. Then find the time period and maximum velocity of the particle. (x \rightarrow m, y \rightarrow cm, t \rightarrow sec.)
- 3. You have learnt that a travelling wave in one dimension is represented by a function y = f(x, t) where x and t must appear in the combination x vt or x + vt, i.e. $y = F(x \pm vt)$. Is the converse true? Examine if the following functions for y can possibly represent a travelling wave:

(a)
$$(x - vt)^2$$

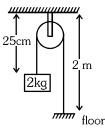

(b)
$$\log [(x + vt)/x_0]$$

(c)
$$\exp \left[-(x + vt)/x_0\right]$$

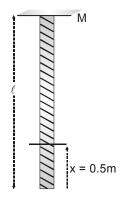

(d)
$$1/(x + vt)$$

4. In the given figure the string has mass $4.5 \, g$. Find the time taken by a transverse pulse produced at the floor to reach the pulley. ($g = 10 \, \text{ms}^{-2}$).

- 5. A wave moves with speed 300 ms^{-1} on a wire which is under a tension of 500 N. Find how much the tension must be changed to increase the speed to 360 ms^{-1} .
- **6.** A string of mass 2.50 kg is under a tension of 200 N. The length of the stretched string is 20.0 m. If the transverse jerk is struck at one end of the string, how long does the disturbance take to reach the other end?
- **7.** A uniform rope of mass 0.1 kg and length 2.45 m hangs from a ceiling as shown in diagram.

- (a) find speed of transverse wave in the rope at a point 0.5 m distance from the lower end.
- (b) Calculate time taken by a transverse wave to travel the full length of rope.

3. SOUND WAVES & ITS CHARACTERISTICS

3.1 Ultrasonic, Infrasonic and Audible Sound

Sound waves can be classified in three groups according to their range of frequencies.

Infrasonic Waves

Longitudinal waves having frequencies below 20 Hz are called infrasonic waves. They cannot be heard by human beings. They are produced during earthquakes. Infrasonic waves can be heard by snakes.

Audible Waves

Longitudinal waves having frequencies lying between 20-20,000 Hz are called audible waves.

Ultrasonic Waves

Longitudinal waves having frequencies above 20,000 Hz are called ultrasonic waves. They are produced and heard by bats. They have a large energy content.

Applications of Ultrasonic Waves

Ultrasonic waves have a large range of applications. Ultrasonic waves can be used -

- (i) to detect fine internal cracks in metal. (ii) for determining the depth of the sea, lakes etc.
- (iii) to detect submarines, icebergs etc. (iv) to clean clothes, fine machinery parts etc.
- (v) to kill smaller animals like rats, fish and frogs etc.

Equations of sound wave

A longitudinal mechanical wave can be described in two ways:

- (A) Displacement wave form (B) Pressure wave form
- (A) **Displacement wave form:** When sound wave is described in term of longitudinal displacement suffered by particles of the medium, it is called displacement wave.

Which can be given by
$$y = A \sin(\omega t - kx)$$

Pressure wave form: - When sound wave is described in term of excess pressure generated due to compression **(B)** and rarefaction called pressure wave.

Which can be given by
$$\Delta P = P_0 \cos(\omega t - kx)$$

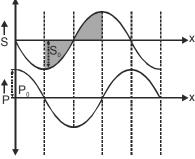

$$P_0 = ABK$$
 where $A = displacement of amplitude, $B = Bulk modulus$$

$$K = propagation constant,$$
 $P_0 = Amplitude of pressure wave$

$$P = Pressure in sound wave$$

- The phase difference between pressure wave form and displacement
- wave form is 90° and path diff is $\lambda/4$. Displacement will be maximum when pressure is minimum and vice versa. When we consider the interference of sound as pressure wave then there is no change in phase when reflected from a "rigid boundary" but have a phase change of π when reflected from free end.

This is in contrast to reflection of displacement wave which have a phase change of π from a "rigid-end" and no change in phase from "free-end".

- A sound sensor-eg. ear, mike or listener, observer detects change in pressure. So in this case we prefer pressure wave.
- If detector is displacement sensor, we will prefer displacement wave.
- In stationary wave at the place of displacement node, pressure antinode will form and vice versa.

Speed of longitudinal (Sound) waves

Newton Formula :
$$v_{medium} = \sqrt{\frac{E}{\rho}}$$
 (Use for every medium)

where E = Elasticity coefficient of medium & $\rho = Density$ of medium

- $v_{solid} = \sqrt{\frac{Y}{\rho}}$ where E = Y = Young's modulus of elasticity For solid medium:
- $v_{liquid} = \sqrt{\frac{B}{\rho}}$ where E = B, where B = volume elasticity coefficient of liquid For liquid medium:

For gas medium:

The formula for velocity of sound in air was first obtained by Newton. He assumed that when sound propagates through air temperature remains constant (i.e. the process is isothermal).

so
$$E_{IT} = P : v_{air} = \sqrt{(P/\rho)}$$

At NTP for air
$$P = 1.01 \times 10^5 \text{ N/m}^2$$
 and $\rho = 1.3 \text{ kg/m}^3$ so $v_{air} = \sqrt{\frac{1.01 \times 10^5}{1.3}} = 279 \text{ m/s}$

However, the experimental value of sound in air is 332 m/s which is much higher than that given by Newton's formula.

Laplace Correction

In order to remove the discrepancy between theoretical and experimental values of velocity of sound, Laplace modified Newton's formula assuming that propagation of sound in air is adiabatic process, i.e.

$$E_{AD} = \gamma p$$
 so that $v = \sqrt{\frac{\gamma P}{\rho}}$ i.e. $v = \sqrt{1.41} \times 279 = 331.3 \text{ m/s [as } \gamma_{air} = 1.41]$

Which is in good agreement with the experimental value (332 m/s). This establishes that sound propagates adiabatically through gases.

The velocity of sound in air at NTP is 332 m/s which is much lesser than that of light and radio-waves (= 3×10^8 m/s). This implies that –

- If we set our watch by the sound of a distant siren it will be slow. (a)
- (b) If we record the time in a race by hearing sound from starting point it will be lesser than actual.
- In a cloud-lightening, though light and sound are produced simultaneously but as c > v, light preceds (c) thunder.

In case of gases –

$$v_{_{S}} = \sqrt{\frac{\gamma P}{\rho}} = \sqrt{\frac{\gamma PV}{mass}} \quad \left[\text{as} \quad \rho = \frac{mass}{volume} = \frac{M}{V} \right] \text{ or } v_{_{S}} = \sqrt{\frac{\gamma \; \mu RT}{M}} \left[\text{as } PV = \mu RT \right] \text{ or } v_{_{S}} = \sqrt{\frac{\gamma \; RT}{M_{_{w}}}} \left[\frac{1}{M_{_{w}}} \left(\frac{1}{M_{_{w}}} \right) \right]$$

$$\left[\text{as} \quad \mu = \frac{\text{mass}}{M_{_{w}}} = \frac{M}{M_{_{w}}} \text{ where } M_{_{w}} = \text{Molecular weight} \right]$$

And from kinetic-theory of gases
$$v_{rms} = \sqrt{(3RT/M_w)}$$
 So $\frac{v_s}{v_{rms}} = \sqrt{\frac{\gamma}{3}}$

3.3 Effect of Various Quantities

(a) Effect of temperature

For a gas
$$\gamma \& M_W$$
 is constant $v \propto \sqrt{T} \Rightarrow \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}} \Rightarrow \frac{v_t}{v_0} = \sqrt{\frac{t + 273}{273}} \Rightarrow v_t = v_0 \left[1 + \frac{t}{273}\right]^{\frac{1}{2}}$

By applying Binomial theorem.

(i) For any gas medium
$$v_t = v_0 \left[1 + \frac{t}{546} \right]$$
 (ii) For air : $v_t = v_0 + 0.61t$ m/sec. ($v_0 = 332$ m/sec.)

(b) Effect of Relative Humidity

With increase in humidity, density decreases so from $v = \sqrt{\gamma (P/\rho)}$ we conclude that with rise in humidity velocity of sound increases. This is why sound travels faster in humid air (rainy season) than in dry air (summer) at same temperature. Due to this in rainy season the sound of factories siren and whistle of train can be heard more than summer.

(c) Effect of Pressure

As velocity of sound
$$v = \sqrt{\frac{E}{\rho}} = \sqrt{\frac{\gamma P}{\rho}} = \sqrt{\frac{\gamma RT}{M_w}}$$

So pressure has no effect on velocity of sound in a gas as long as temperature remain constant. This is why while going up in the atmosphere, though both pressure and density decrease, velocity of sound remains constant as long as temperature remains constant. Further more it has also been established that all other factors such as amplitude, frequency, phase, loudness pitch, quality etc. has apparently no effect on velocity of sound.

Velocity of sound in air is measured by resonance tube or Hebb's method while in gases by Quinke's tube. Kundt's tube is used to determine velocity of sound in any medium solid, liquid or gas.

(d) Effect of Motion of Air

If air is blowing then the speed of sound changes. If the actual speed of sound is v and the speed of air is w, then the speed of sound in the direction in which air is blowing will be (v + w), and in the opposite direction it will be (v - w).

(e) Effect of Frequency

There is no effect of frequency on the speed of sound. Sound waves of different frequencies travel with the same speed in air although their wavelength in air are different. If the speed of sound were dependent on the frequency, then we could not have enjoyed orchestra.

3.4 Characteristics of Sound

Sound is characterised by the following three parameters:

Loudness: The quality of sound on the basis of which, sound is said to be high or low. It depends on:

- (1) Shape & size of the source
- (2) Intensity of sound
- \Rightarrow According to **Weber Fechner** the loudness of a sound of intensity I is given by: $L \propto \log_{10}I$ Which is called Weber-Fechner law [unit of L is 'phon' It also measured in decible]

So
$$\Delta L = L_2 - L_1 = 10 \log_{10} \frac{I_2}{I_1}$$

For zero decibel Loudness, Initensity is called threshold of hearing.

In decibel the loudness of a sound of intensity I is given by $L = 10 \log_{10} (I/I_0)$

Where I₀ represents the threshold of hearing at 0 dB loudness level.

The loudness of a roaring lion is more than the sound produced by a mosquito.

Range:

	Intensity	Loudness level
Threshold of hearing	<u>~</u> 10 ⁻¹²	<u>~</u> 0 dB
Whispering	10-11	10 dB
Normal Talk	10-6	60 dB
Shout	10-5	70 dB
non tolerable	1	above 120 dB

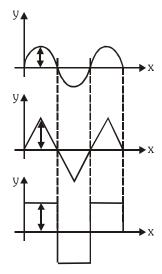

Pitch: It is the sensation received by the ear due to frequency and is the characteristic which distinguishes a shrill (or sharp) sound from a grave (or flat) sound. As pitch depends on frequency, higher the frequency higher will be the pitch and shriller will be the sound. For example

- (1) The buzzing of a bee or humming of a mosquito has high pitch but low loudness while the roar of a lion has large loudness but low pitch.
- (2) Due to more harmonics usually the pitch of female voice is higher than male.

Quality (or timbre): It is the sensation received by the ear due to 'waveform'.

Two sounds of same intensity and frequency as shown in figure will produce different sensation on the ear if their waveforms are different. Now as waveform depends on overtones present, quality of sound depends on number of overtones, i.e., harmonics present and their relative intensities.

GOLDEN KEY POINTS

- The density of a solid is much larger than that of a gas but the elasticity is larger by a greater factor. Hence longitudinal waves in a solid travel much faster than that in a gas.
- In a liquid the speed lies in between the two i.e. $\rm v_{solid} > \rm v_{liquid} > \rm v_{gas}$
- Speed of longitudinal waves in a solid rod : $v = \sqrt{\frac{Y}{2}}$
- Speed of longitudinal waves in a liquid $v = \sqrt{\frac{B}{\rho}}$ Where B is the bulk modulus of elasticity.
- The velocity of mechanical waves or sound waves in gases is given by:

$$v = \sqrt{\frac{\gamma P}{\rho}}$$
 where $P = Pressure$ $\rho = Density$

 γ = ratio of specific heats of the gas at constant pressure and constant volume. This is known as Laplace's formula.

Illustrations —

Illustration 12.

Determine the change in volume of 6 liters of alcohol if the pressure is decreased from 200 cm of Hg to 75 cm. [velocity of sound in alcohol is 1280 m/s, density of alcohol = 0.81 gm/cc, density of Hg = 13.6 gm/cc and $g = 9.81 \text{ m/s}^2$

Solution

For propagation of sound in liquid $v = \sqrt{(B/\rho)}$ i.e., $B = v^2 \rho$

But by definition
$$B = -V \frac{\Delta P}{\Delta V}$$

But by definition
$$B=-V$$
 $\frac{\Delta P}{\Delta V}$ So $-V\frac{\Delta P}{\Delta V}=v^2\rho, \text{ i.e. } \Delta V=\frac{V(-\Delta P)}{\rho v^2}$

😯 Shrivastava Classes, D-27, Near JVTS Garden,Chattarpur Extension New Delhi - 110074

Here $\Delta P = H_p \rho g - H_1 \rho g = (75 - 200) \times 13.6 \times 981 = -1.667 \times 10^6 \text{ dynes/cm}^2$

So
$$\Delta V = \frac{\left(6 \times 10^3\right) \left(1.667 \times 10^6\right)}{0.81 \times \left(1.280 \times 10^5\right)^2} = 0.75 \text{ cc}$$

Illustration 13.

- (a) Speed of sound in air is 332 m/s at NTP. What will be the speed of sound in hydrogen at NTP if the density of hydrogen at NTP is (1/16) that of air.
- (b) Calculate the ratio of the speed of sound in neon to that in water vapour at any temperature. [Molecular weight of neon = 2.02×10^{-2} kg/mol and for water vapours = 1.8×10^{-2} kg/mol]

Solution

The velocity of sound in air is given by v = $\sqrt{\frac{E}{\rho}}$ = $\sqrt{\frac{\gamma \ P}{\rho}}$ = $\sqrt{\frac{\gamma \ RT}{M_w}}$

(a) In terms of density and pressure $\frac{v_H}{v_{air}} = \sqrt{\frac{P_H}{\rho_H} \times \frac{\rho_{air}}{P_{air}}} = \sqrt{\frac{\rho_{air}}{\rho_H}}$ [as $P_{air} = P_H$]

$$\Rightarrow \qquad v_{_{\! H}} = v_{_{\! air}} \times \sqrt{\frac{\rho_{_{\! air}}}{\rho_{_{\! H}}}} \ = 332 \times \sqrt{\frac{16}{1}} \ = 1328 \ m/s$$

(b) In terms of temperature and molecular weight $\frac{v_{Ne}}{v_W} = \sqrt{\frac{\gamma_{Ne}}{M_{Ne}}} \times \frac{M_W}{\gamma_W}$ [as $T_{Ne} = T_W$]

Now as neon is mono atomic ($\gamma = 5/3$) while water vapours poly atomic ($\gamma = 4/3$) so

$$\frac{v_{Ne}}{v_W} = \sqrt{\frac{(5/3) \times 1.8 \times 10^{-2}}{(4/3) \times 2.02 \times 10^{-2}}} = \sqrt{\frac{5}{4} \times \frac{1.8}{2.02}} = 1.055$$

BEGINNER'S BOX-3

1. A 1000 m long rod of density 10.0×10^4 kg/m³ and having young's modulus $Y = 10^{11}$ Pa, is clamped at one end. It is hammered at the other free end as shown in the figure. The longitudinal pulse goes to right end, gets reflected and again returns to the left end. How much time (in sec) the pulse will take to go back to initial point?

- 2. If the bulk modulus of water is 4000 MPa, what is the speed of sound in water?
- 3. The minimum intensity of audibility of sound is 10^{-12} watt/m². If the intensity of sound is 10^{-9} watt/m², then calculate the intensity level of this sound in decibels.
- 4. Sound can be heard at great distances after rainfall. Explain.

- **5.** A sound wave is propagating in given gaseous medium then plot graph between
 - (a) $v_{gas} \& T$
 - (b) $v_{gas} \& P$
 - (c) $v_{gas} & \sqrt{T}$

 $[v_{\text{qas}} = \text{Speed of sound} \ , \ P = \text{Pressure} \ , \ T = \text{Temperature}] \ Also write down proper units on axis.$

- **6.** Why are temple bells made of large size?
- 7. Explain why sound travels faster in warm air than in cool air?
- **8.** Explosion on other planets are not heard on earth. Explain why?
- **9.** Calculate velocity of sound in mixture of 1 mole He and 1 mole ${\rm O_2}$ at 127°C.
- 10. Use the formula $v = \sqrt{\frac{\gamma P}{\rho}}$ to explain why the speed of sound in air
 - (a) is independent of pressure.
- (b) increases with temperature.
- (c) increases with humidity.

4. PRINCIPLE OF SUPERPOSITION OF WAVES

4.1 Superposition of Waves

Two or more waves can traverse the same medium without affecting the motion of one another. If several waves propagate in a medium simultaneously, then the resultant displacement of any particle of the medium at any instant is equal to the vector sum of the displacements produced by individual wave. The phenomenon of intermixing of two or more waves to produce a new wave is called Superposition of waves. Therefore according to superposition principle.

The resultant displacement of a particle at any point of the medium, at any instant of time is the vector sum of the displacements caused to the particle by the individual waves.

If $\vec{y}_1, \vec{y}_2, \vec{y}_3, ...$ are the displacement of particle at a particular time due to individual waves, then the resultant displacement is given by $\vec{y} = \vec{y}_1 + \vec{y}_2 + \vec{y}_3 + ...$

Principle of superposition holds for all types of waves, i.e., mechanical as well as electromagnetic waves. But this principle is not applicable to the waves of very large amplitude.

Due to superposition of waves the following phenomenon can be seen

- 1. **Interference**: Superposition of two waves having equal frequency and nearly equal amplitude.
- **2. Beats**: Superposition of two waves of nearly equal frequency in same direction.
- **3. Stationary waves:** Superposition of equal waves from opposite direction.
- 4. **Lissajous' figure :** Superposition of perpendicular waves.

4.2 Interference

When two coherent waves of same frequency propagate in same direction and superimpose on one another then the intensity of resultant wave becomes maximum at some points and at some points it becomes minimum. This phenomena of intensity variation w.r.t. position is known as interference.

Coherent Waves:

Two waves are said to be coherent if their phase difference does not depend on time.

(a) Mathematcial Analysis

First wave
$$\implies$$
 $Y_1 = a_1 \sin(\omega t + \phi_1)$

Second wave
$$\Rightarrow Y_2 = a_2 \sin(\omega t + \phi_2)$$

$$\Delta \phi$$
= phase difference = ϕ_1 - ϕ_2

For Ist
$$I_1 \propto a_1^2$$

For IInd
$$I_2 \propto a_2^2$$

From superpostion

Resultant wave =
$$y = y_1 + y_2$$
, $y = A \sin(\omega t + \theta)$

$$I \rightarrow I_1 \propto a_1^2 \Rightarrow I_1 = Ka_1^2$$

$$I_2 \propto a_2^2$$
 \Rightarrow $I_2 = Ka_2$

$$I \propto A^2$$
 $\Rightarrow I = KA^2$

$$\boxed{A^2 = a_1^2 + a_2^2 + 2a_1a_2\cos\Delta\phi} \qquad \Rightarrow \qquad \boxed{I = I_1 + I_2 + 2\sqrt{I_1}\sqrt{I_2}\cos\Delta\phi}$$

(b) Types of Interference

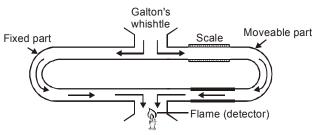

$$A^2 {=} {a_{_1}}^2 {+} {a_{_2}}^2 {+} 2 a_{_1} a_{_2} \cos \Delta \varphi, \quad I = I_{_1} + I_{_2} + 2 \sqrt{I_{_1}} \sqrt{I_{_2}} \ \cos \Delta \varphi$$

Constructive Interference :	Destructive Interference :
Same Phase [Maxima]	OppositePhase [Minima]
\Rightarrow If $\cos \Delta \phi = +1 \Rightarrow$ then $I_{max} \& A_{max}$	If $\cos \Delta \phi = -1 \implies \text{then } I_{\text{min}} \& A_{\text{min}}$
therefore phase difference $\Delta\varphi=0,2\pi,4\pi,6\pi,~2N\pi$	therefore phase difference $\Delta \varphi = \pi$, 3π , 5π , 7π $(2N+1)\pi$
(N = 0, 1, 2,)	(N = 0, 1, 2)
and Path difference $\Delta\lambda=0,\lambda,2\lambda,3\lambdaN\lambda$	and path difference $\Delta\lambda = \lambda/2, \ 3\lambda/2, 5\lambda/2, \ (2N+1) \ \lambda/2$
(N= 0, 1, 2,)	(N= 0, 1, 2) Put the value of $\Delta\varphi$ in the formula
So $A_{max} = a_1 + a_2$ and $I_{max} = I_1 + I_2 + 2\sqrt{I_1}\sqrt{I_2}$	$A_{min} = a_1 - a_2$ and $I_{min} = I_1 + I_2 - 2\sqrt{I_1}\sqrt{I_2}$ or
or $I_{max} = (\sqrt{I_1} + \sqrt{I_2})^2$ and obviously $I_{max} > I_1 + I_2$	$I_{\min} = \left(\sqrt{I_1} - \sqrt{I_2}\right)^2 \text{ obviously } I_{\min} < I_1 + I_2 \;,$
or $I_{\text{max}} \propto (a_1 + a_2)^2$	$I_{\min} \propto (a_1 - a_2)^2$

If path difference is zero then maxima is obtained, if path difference is $\lambda/2$ then minima and if path difference is λ then maxima. If path difference is $3\lambda/2$ then minima. So the distance between to consecutive maximum or to consecutive minima is λ .

(c) Quincke's Tube :-

- (1) It gives practical proof of interference of sound.
- (2) Quincke's tube is practical method for finding the speed of sound in gaseous medium.
- (3) (a) As we slide movable part of tube by ℓ unit, path difference will become 2ℓ so $\Delta x = 2\ell$.

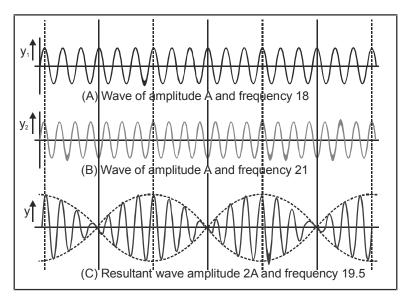

- (b) If vibration in flame becomes **maximum** to **minimum** or **minimum** to **maximum** then $\Delta x = \frac{\lambda}{2} = 2\ell$
- (c) If vibration in flame becomes **minimum** to **minimum** or **maximum** to **maximum** then $\Delta x = \lambda = 2\ell$

- (4) Quincke tube is used as a sound filter.
- (5) Galton's whistle produces ultrasonic waves.

4.3 Beats

When two sound waves of nearly equal (but not exactly equal) frequencies travel in same direction, at a given point due to their super position, intensity alternatively increases and decreases periodically. This periodic waxing and waning of sound at a given position is called beats.

1. Condition: Two waves of approximatly equal frequency propagate in same direction

Time	n ₁ = 12 Hz	n ₂ = 10 Hz	Diff. of vibration	phase diff.	Intensity	Remarks
0 sec.	0	0	0	0	Max.	
¼ sec.	3	2.5	0.5	π	Min.	
½ sec.	6	5	1	2π	Max.	Ist Beat
3/4 sec.	9	7.5	1.5	3π	Min.	
1 sec.	12	10	2	4π	Max.	IInd Beat
	Beat frequency (b) = $n_1 \sim n_2$			(~ = positive d	ifference)	1

2. Mathematical analysis:

$$I \longrightarrow y_1 = a \sin \omega_1 t = a \sin 2\pi n_1 t$$

$$II \longrightarrow y_2 = a \sin \omega_2 t = a \sin 2\pi n_2 t$$

For surperposition

$$y = y_1 + y_2 = a \left\{ \sin 2\pi \, n_1 t + \sin 2\pi \, n_2 t \right\} = a \left\{ 2 \sin 2\pi \frac{\left(n_1 + n_2\right)t}{2} \cos 2\pi \frac{\left(n_1 - n_2\right)t}{2} \right\}$$

$$y = \left[2a \cos 2\pi \frac{\left(n_1 - n_2\right)t}{2} \right] \sin 2\pi \frac{\left(n_1 + n_2\right)t}{2}$$

$$y = A \sin 2\pi n't$$
 Resultant wave $= y = A \sin 2\pi n't$ Amplitude $A = 2a \cos 2\pi \frac{(n_1 - n_2)t}{2}$

Frequency of resultant wave \Rightarrow n' = $(n_1 + n_2)/2$

GOLDEN KEY POINTS

- Superposition phenomena is applicable for all types of waves.
- For the resultant wave in interference phenomenon frequency, wavelength & velocity is identical to intial or super-posing waves but, its amplitude and intial phase is changed.
- Superposition phenomena applicable for all vector quantities.

$$\bullet \qquad \frac{I_{\text{max}}}{I_{\text{min}}} = \left(\frac{\sqrt{I_1} + \sqrt{I_2}}{\sqrt{I_1} - \sqrt{I_2}}\right)^2 = \frac{\left(a_1 + a_2\right)^2}{\left(a_1 - a_2\right)^2} \text{ and } \frac{I_1}{I_2} = \left(\frac{a_1}{a_2}\right)^2$$

Average intensity of interference pattern

$$I_{av}$$
 or $< I > = \frac{I_{max} + I_{min}}{2}$ or $I_{av} = I_1 + I_2$

 I_{av} = Sum of intensities of individual waves

• **Degree of Interference pattern (f)** = f represents contrast effect (clarity of interference pattern)

$$f = \frac{I_{max} - I_{min}}{I_{max} + I_{min}} \times 100\%$$

Conditions for perfect interference

If
$$a_1=a_2=a$$
 and $I_1=I_2=I$ $I_{max}=4I$ $I_{min}=0$
$$\frac{I_{max}}{I_{av}}=\frac{2}{1} \Rightarrow I_{av}=2I \qquad \qquad f_{max}=1 \text{ (unity)}=100\%$$

- Above formulae and Results also apply to interference of light.
- Frequency of resultant wave = $\frac{\left(n_1 + n_2\right)}{2}$, beats frequency or freq of intensity variation = $n_1 \sim n_2$ Frequency of amplitude variation = $\frac{n_1 \sim n_2}{2}$
- When source of higher frequency execute one vibration more than source of lower frequency, one beat is formed.

 $2\pi \equiv T$ (one oscillation difference)

- No. of Beats formed per sec is known as Beat frequency and time taken to complete one beat is known as beat time period.
- **Interference**:- Permanent intensity pattern and it is the function of position [I = f(x)]

Beats: Temporary intensity pattern and it is the function of time [I = f(t)]

- Periodic vibration in the intensity (or amplitude) of sound due to superposition of two sound waves of slightly different frequencies are called beats.
- To hear beats, the number of beats per second should not be more than ten beats per sec. $(n_1 \sim n_2 < 10)$
- Filing the prongs of tuning fork raises the frequency and loading deacreases the frequency.
- **Vibration of tuning fork:** when tuning fork is sounded by striking its one end on rubber pad, then the ends of prongs vibrate in and out while the stem vibrates up and down or vibration of the prongs are transverse and that of the stem is longitudinal. Generally tuning fork produces fundamental tone.

Illustrations

Illustration 14.

If
$$\frac{I_{\text{max}}}{I_{\text{min}}} = \frac{25}{1}$$
 then $\frac{I_1}{I_2}$?

Solution. If
$$\frac{I_{\text{max}}}{I_{\text{min}}} = \frac{25}{1} \Rightarrow \frac{a_1 + a_2}{a_1 - a_2} = \frac{5}{1}$$
 (by C & D) $\frac{a_1}{a_2} = \frac{6}{4} = \frac{3}{2}$ Thus $\frac{I_1}{I_2} = \frac{9}{4}$

Illustration 15.

In interference phenomena if the degree of interference pattern in interference is 60% then find the ratio of intensity & amplitudes of interferring wave form.

Solution.

$$\begin{split} \frac{I_{\text{max}} - I_{\text{min}}}{I_{\text{max}} + I_{\text{min}}} &= \frac{60}{100} = \frac{3}{5} \\ \text{Thus } \frac{a_1 + a_2}{a_1 - a_2} &= \frac{2}{1} \\ \end{split} \quad \text{8} \quad \frac{a_1}{a_2} &= \frac{2+1}{2-1} = \frac{3}{1} \\ \text{thus } \quad \frac{I_1}{I_2} &= \frac{9}{1} \quad \text{Ans.} \end{split}$$

Illustration 16.

T.F. having n = 300 Hz produces 5 beats/sec. with another T.F. If impurity is added on the arm of known tuning fork number of beats decreases then find frequency of unknown T.F.?

If it would be 305 Hz, beats would have increased but with 295 Hz beats decreases so answer is 295 Hz.

Illustration 17.

A T. F. having n = 158 Hz, produce 3 beats/sec. with another T. F. As we file the arm of unknown, beats become 7 then find frequency of unknown.

Solution. before filling
$$158 \pm 3$$
 so 155 or 161 after filling $b = 7$

$$155 158 161 165 (after filling)$$
filling filling

Both T.F. give 7 beat/sec. after filling. So answer is both.

Illustration 18.

41 tuning forks are arranged in a series in such a way that each T.F. produce 3 beats with its neighbouring T.F. If the frequency of last is 3 times of first then find the frequency of 1^{st} 11^{th} 16^{th} 21^{st} & last T.F.

Solution.
$$n_1 = n$$
 (let) So $n_{41} = 3n$ (according to Que.) $n_2 = n + b$ $n_3 = n + 2b$ So $n_{41} = n + 40 \times 3$ $n_4 = n + 3b$ $3n = n + 120$ $n_{41} = n + 40 b$ $n = 60 \text{ Hz}$ $n_{11} = n + 10 b = 90 \text{ Hz}$, $n_{16} = n + 15 b = 105 \text{ Hz}$ $n_{21} = n + 20b = 120 \text{ Hz}$

Illustration 19.

Three simple harmonic waves, identical in frequency n and amplitude A moving in the same direction are superimposed in air in such a way, that the first, second and the third wave have the phase angles $\phi, \phi + \frac{\pi}{2}$ and $(\phi+\pi)$ respectively at a given point P in the superpositon.

Then as the waves progress, the superposition will result in

- (1) a periodic, non-simple harmonic wave of amplitude 3A
- (2) a stationary simple harmonic wave of amplitude 3A
- (3) a simple harmonic progressive wave of amplitude A
- (4) the velocity of the superposed resultant wave will be the same as the velocity of each wave

Solution Ans. (3,4)

Since the first wave and the third wave moving in the same direction have the phase angles ϕ and $(\phi+\pi)$, they superpose with opposite phase at every point of the vibrating medium and thus cancel out each other, in displacement, velocity and acceleration. They, in effect, destroy each other out. Hence we are left with only the second wave which progresses as a simple harmonic wave of amplitude A. The velocity of this wave is the same

Illustration 20.

Two vibrating tuning forks produce progressive waves given by $y_1 = 4 \sin(500\pi t)$ and $y_2 = 2 \sin(506\pi t)$. These tuning forks are held near the ear of a person. The person will hear α beats/s with intensity ratio between maxima and minima equal to β . Find the value of $\beta - \alpha$.

Solution Ans. 6

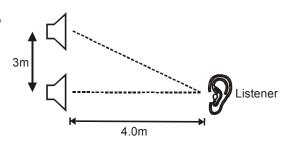

$$y_1 = 4\sin(500 \text{ nt})$$
 $y_2 = 2\sin(506 \text{ nt})$

Number of beats = 253 - 250 = 3 beat/sec $\Rightarrow \alpha = 3$ beats/sec

As
$$I_1 \propto (16)$$
 and $I_2 \propto 4 \Rightarrow \frac{I_{\text{max}}}{I_{\text{min}}} = \frac{\left(\sqrt{I_1} + \sqrt{I_2}\right)^2}{\left(\sqrt{I_1} - \sqrt{I_2}\right)^2} \Rightarrow \left(\frac{4+2}{4-2}\right)^2 = \left(\frac{6}{2}\right)^2 = 9 \Rightarrow \beta = 9$
So $\beta = \alpha = 9 = 3 = 6$

Illustration 21.

Two loudspeakers as shown in fig. below separated by a distance 3 m, are in phase. Assume that the amplitudes of the sound from the speakers is approximately same at the position of a listener, Who is at a distance $4.0~\mathrm{m}$ in front of one of the speakers. For what frequencies does the listener hear minimum signal ? Given that the speed of sound in air is $330~\mathrm{ms}^{-1}$.

Solution

The distance of the listener from the second speaker = $\sqrt{(3)^2 + (4)^2}$ = $\sqrt{25}$ = 5 m

path difference =
$$(5 - 4.0)$$
 m = 1 m

For fully destructive interference 1 m = $(2m + 1)\lambda/2$

Hence
$$\lambda = 2/(2m + 1) m$$

The corresponding frequencies are given by

$$n = [330 \times (2m + 1)]/2 \text{ s}^{-1}, \text{ for } m = 0, 1, 2, 3, 4, \dots$$

$$= 165 (2m + 1) \text{ s}^{-1}, \text{ for } m = 0, 1, 2, 3, 4, \dots$$

Therefore the frequencies for which the listener would hear a minimum intensity 165 Hz. 495 Hz, 825 Hz,

Illustration 22.

Two plane harmonic sound waves are expressed by the following equations

$$y_1(x,t) = A \sin(0.5 \pi x - 100 \pi t)$$

$$y_2(x,t) = A \sin (0.48\pi x - 96 \pi t)$$

(All parameters are in MKS system)

- (a) How many times does an observer hear maximum intensity in 1 second?
- (b) What is the speed of the sound?
- (c) What is the amplitude of $y_1 + y_2$ at x = 0 and t = 0.25 s?

Solution

(a) Beat frequency =
$$f_1 - f_2 = \frac{1}{2\pi} [100 \pi - 96 \pi] = 2$$

Therefore observer heard maximum intensity twice in one second.

(b) Speed of the sound wave =
$$\frac{\omega_1}{k_1} = \frac{100\pi}{0.5\pi} = 200~\text{ms}^{-1}$$

(c) At
$$x = 0$$
 & $t = 0.25$ s $y_1 = 0$ & $y_2 = 0$ so $y_1 + y_2 = 0$

Illustration 23.

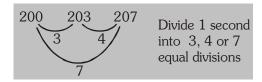

Three tuning forks of frequencies 200, 203 and 207 Hz are sounded together. Find out the beat frequency.

Solution

$$\frac{1}{3}$$
 $\frac{2}{3}$ $\left(\frac{3}{3}\right)$

$$\frac{1}{4}$$
 $\frac{2}{4}$ $\frac{3}{4}$ $\left(\frac{4}{4}\right)$

Eliminate common time instants. Total Maxima in one second 3 + 3 + 6 = 12

BEGINNER'S BOX-4

- **1.** Two waves having same frequency and same amplitude are superimposed at a point. Find the phase difference between two waves if resultant amplitude is :
 - (i) 2a

- (ii) $\sqrt{2}a$
- (iii) a

- (iv) Zero
- **2.** During interference phenomenon of two wave it is observed that maximum amplitude to minimum amplitude ratio is 9 : 7. Find the intensity ratio of waves.
- **3.** During interference phenomenon of two wave it is observed that amplitude ratio of waves is 5 : 4. Find the maximum to minimum intensity ratio of resulting wave.

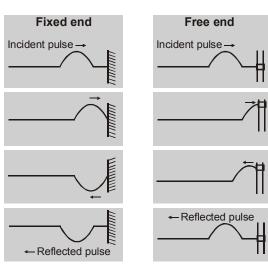

- 4. Two sound waves emitted by one sound source is approaching at a point through two path. When path difference is 36 cm or 60 cm, then points are silence point if speed of sound in air 330 m/sec then find the frequency of sound source.
- 5. In a Quincke's tube there are two positions where sound becomes minimum, the sliding distance between them is 16.6 cm. Find the freq. of sound source. (Sound velocity in air = 332 m/sec.)
- **6.** A tuning fork having frequency 300 Hz produce, four beats per sec with x. If we file arm of unknown and again vibrate, number of beats decreases. Determine x.
- **7.** 81 TF are arranged in the increasing order of their frequency and each TF produce 4 beats per sec. with its near by TF. If the frequency of last TF is octave of frequency of first TF then find the frequency of last TF.
- **8.** Two sound waves $y_1 = 3 \sin 400\pi t$; $y_2 = 4 \sin 402\pi t$
 - (a) Find frequency of resultant wave
 - (b) Beat frequency
 - (c) Intensity ratio of waves
- **9.** A Standard tuning fork contains frequency n_0 , another TF n_A have 20% more compared to n_0 , n_B 30% more compared to n_0 , n_A & n_B have beat relation of 6 beat/sec. Then determine n_0 , n_A , n_B
- 10. Two tuning fork having frequency 320 Hz & 324 Hz produce beat phenomena. Determine -
 - (a) Beat time period
 - (b) Minimum time interval in which maximum intensity become minimum.
 - (c) Number of beat per three seconds.
- 11. Two audio speakers are kept some distance apart and are driven by the same amplifier system. A person is sitting at a place 6.0 m from one of the speakers and 6.4 m from the other. If the sound signal is continuously varied from 500 Hz to 5000 Hz, what are the frequencies for which there is a destructive interference at the place of the listener? Speed of sound in air = 320 m/s.
- 12. 51 tuning fork are arranged in a series in such a way that each fork produce five beats/sec with neighbouring tunning fork. If frequency of last is six time of first then determine frequency of first, 11^{th} , 17^{th} , 27^{th} , 33^{th} and last tunning fork.

5. REFLECTION OF WAVES, STATIONARY WAVES, STANDING WAVES IN STRINGS AND ORGAN PIPE

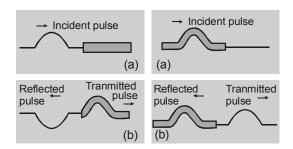

5.1 Reflection and transmission of waves

Whenever a travelling wave reaches a boundary, part or all of the wave will be reflected. For example, consider a pulse travelling on a string fixed at one end (figure). When the pulse reaches the fixed wall, it will be reflected. Since the support attaching the string to the wall is assumed to be rigid, it does not transmit any part of the disturbance to the wall. Note that the reflected pulse is inverted. This can be explained by Newton's third law, the support must exert an equal and opposite (downward) reaction force on the string. This downward force causes the pulse to invert upon reflection.

Now consider another case where the pulse arrives at the end of a string that is free to move vertically. The tension at the free end is maintained by tying the string to a ring of negligible mass that to slide vertically on a smooth post. Again, the pulse will be reflected, but this time its displacement is not inverted. As the pulse reaches the post, it exerts a force on the free end, causing the ring to accelerate upward.

In the process, the ring "overshoots" the height of the incoming pulse and is then returned to its original position by the downward component of the tension.

Finally, we may have a situation in which the boundary is intermediate between these two extreme cases, that is, one in which the boundary is neither rigid nor free. In this case, part of the incident energy is transmitted and part is reflected. For instance, suppose a light string is attached to a heavier string as shown in figure. When a pulse travelling on the light reaches the junction, part of it is reflected and inverted, and part of it is transmitted to the heavier string. As one would expect, the reflected pulse has a smaller amplitude than the incident pulse, since part of the incident energy is transferred to the pulse in the heavier string. The inversion in the reflected wave is similar to the behavior of a pulse meeting a rigid boundary, when it is totally reflected.

When a pulse travelling on a heavy string strikes the boundary of a lighter string, as shown in figure, again part is reflected and part is transmitted. However, in this case the reflected pulse is not inverted. In either case, the relative height of the reflected and transmitted pulses depend on the relative densities of the two string.

Thus, the speed of a wave on a string increases as the density of the string decreases. That is, a pulse travels more slowly on a heavy string than on a light string, if both are under the same tension. The following general rules apply to reflected waves:

- (1) When a wave pulse travels from medium A to medium B and $v_A > v_B$ (B is denser than A), the pulse will be inverted upon reflection.
- When a wave pulse travels from medium A to medium B and $v_A < v_B$ (A is denser than B), it will not be inverted upon reflection.

5.2 Stationary Waves

- (1) When two indentical progressive waves (transverse or longitudinal) propagating in opposite direction superimpose in a bounded medium (having boundaries) the resultant wave is called **stationary wave or standing wave**.
- (2) Stationary wave pattern may be obtained only and only in limited region.
- (3) We can obtain two same type of progressive waves, only & only by method of reflection.
- (4) According to the nature of reflected surface, reflection are of two types –

9810934436, 8076575278, 8700391727

(a) Rigid End

In such type of reflection incident and reflected waves have phase difference of π and direction of propagation are opposite.

incident wave $y_1 = a \sin(\omega t - kx)$

reflected wave $y_2 = a \sin(\omega t + kx + \pi)$

or
$$y_2 = -a \sin(\omega t + kx)$$

$$y = y_1 + y_2$$

 $y = a \{ \sin (\omega t - kx) - \sin (\omega t + kx) \}$ after solving

 $y = -2a\sin kx \cos \omega t$

 $y = -A \cos \omega t$ where $A = 2a \sin kx$

at
$$x = 0$$
 $A = 0$

(b) Free End

In such type of reflection incident and reflected waves are in phase and direction of propagation are opposite.

incident wave $y_1 = a \sin (\omega t - kx)$ reflected wave $y_2 = a \sin (\omega t + kx)$

From superposition of wave

$$y = y_1 + y_2$$

 $y = a \{ \sin(\omega t - kx) + \sin(\omega t + kx) \}$

after solving

 $y = 2a \cos kx \sin \omega t$

 $y = A \sin \omega t$ where $A = 2a \cos kx$

so
$$x = 0$$
 and $A = 2a$

Special properties of stationary wave pattern

- **Zero wave velocity:** No transfer of energy between two points, particle velocity is non zero but wave velocity is zero.
- Position of antinodes & nodes in this pattern remains fix.
- The particles between two consecutive nodes vibrate in same phase while medium particles nearby of any node on both sides always vibrate in opposite phase.
- All medium particles doing simple harmonic vibrations have identical time period but different vibration Amplitude and because of this their maximum velocity at mean position is different
- All medium particles pass through their mean position simultaneously but with different maximum velocity.
- All medium particles pass their mean position in their one complete vibration two times hence stationary wave pattern is obtained as straight line twice in its one complete cycle.
- In this pattern, at antinode position, displacement and velocity is maximum, but wave strain is minimum.

Strain = slope of stationary wave pattern
$$\left(\frac{dy}{dx}\right)$$

At node position displacement and velocity is minimum but wave strain is maximum.

• Amplitude of incident wave > Amplitude of reflected wave

For node
$$a_1 - a_2 \Rightarrow minima$$

For antinode
$$a_1 + a_2 \Rightarrow maxima$$

 For any wave each and every reflecting surface have some absorptive power and due to this the energy, intensity & amplitude of reflected wave is always less compared to that of incident wave. Two waves differ in their amplitude having same frequency and wavelength and propagate in reverse or opposite direction always give stationary wave pattern by their superposition.

- According to nature of superposing waves stationary waves are of two types
 - Transverse stationary waves → Musical instruments based on wire (sonometer).
 - Longitudinal stationary waves \rightarrow Musical instruments based on air (resonance tube).
- Only applied to longitudinal stationary wave

$$\rightarrow \rightarrow N \leftarrow \leftarrow$$
 Pressure \uparrow density \uparrow (compression)

If medium particles move in this way

$$\begin{array}{ccc} & & & & \\ & \leftarrow & \mathsf{N} \to & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ &$$

at antinode $\ \ \rightarrow \ \ \$ Pressure & density constant so variations min.

at node \rightarrow Pressure & density variations maximum.

•
$$E_{gas} = \frac{change \text{ in pressure}}{volumetric \text{ strain}} = \frac{dP}{\left(\frac{dy}{dx}\right)} = const. \text{ then } dP \propto strain} \left(\frac{dy}{dx}\right)$$

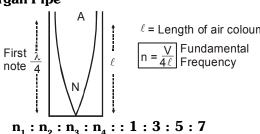

So strain is maximum at node positions and minimum at antinode positions.

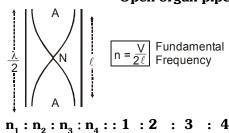

Longitudinal Stationary waves [Organ pipe (Ex. Resonance Tube)]

Transverse Stationary waves
[Vibration in stretched string (Ex.Sonometer)]

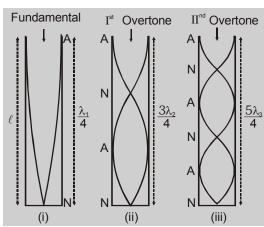

5.3 Vibration of Air Columns

When two longitudinal waves of same frequency and amplitude travel in a medium in opposite directions then by superposition, standing waves are produced. These waves are produced in air columns in cylindrical tube of uniform diameter. These sound producing tubes are called organ pipes.

Vibration of air column in closed organ pipe:

The tube which is closed at one end and open at the other end is called closed organ pipe. On blowing air at the open end, a wave travels towards closed end from where it is reflected towards open end. As the wave reaches open end, it is reflected again. So two longitudinal waves travel in opposite directions to superpose and produce stationary waves. At the closed end there is a node since particles does not have freedom to vibrate whereas at open end there is an antinode because particles have greatest freedom to vibrate.

9810934436, 8076575278, 8700391727

Hence on blowing air at the open end, the column vibrates forming antinode at free end and node at closed end. If ℓ is length of pipe and λ be the wavelength and v be the velocity of of sound in organ pipe then

$$\text{Case (i)} \ \ \ell = \frac{\lambda_1}{4} \qquad \qquad \Rightarrow \qquad \lambda_1 = 4 \ell \qquad \Rightarrow \qquad n_1 = \frac{\nu}{\lambda_1} = \frac{\nu}{4 \ell} \qquad \qquad \text{Fundamental frequency}.$$

Case (ii)
$$\ell = \frac{3\lambda_2}{4}$$
 \Rightarrow $\lambda_2 = \frac{4\ell}{3}$ \Rightarrow $n_2 = \frac{v}{\lambda_2} = \frac{3v}{4\ell} = 3n_1$ First overtone frequency.

$$\text{Case (iii)} \ \ \ell = \frac{5\lambda_3}{4} \qquad \qquad \Rightarrow \qquad \lambda_3 = \frac{4\ell}{5} \qquad \Rightarrow \qquad n_3 = \frac{v}{\lambda_3} = \frac{5v}{4\ell} = 5n_1 \qquad \quad \text{Second overtone frequency}.$$

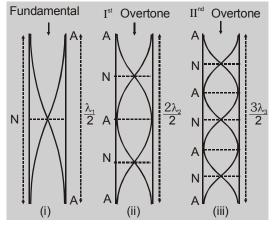

When closed organ pipe vibrate in mth overtone then

$$\ell = (2m+1)\frac{\lambda}{4} \qquad \text{ so } \qquad \lambda = \frac{4\ell}{(2m+1)} \Longrightarrow \qquad n = (2m+1)\frac{\nu}{4\ell}$$

Hence frequency of overtones is given by $n_1 : n_2 : n_3 : \dots = 1 : 3 : 5 \dots$

Vibration of air columns in open organ pipe:

The tube which is open at both ends is called an open organ pipe. On blowing air at the open end, a wave travel towards the other end from which waves travel in opposite direction to superpose and produce stationary wave. Now the pipe is open at both ends by which an antinode is formed at open end. Hence on blowing air at the open end antinodes are formed at each end and nodes in the middle. If ℓ is length of the pipe and λ be the wavelength and v is velocity of sound in organ pipe.

$$\text{Case (i)} \ \ell = \frac{\lambda_1}{2} \qquad \Rightarrow \qquad \lambda_1 = 2\ell \qquad \Rightarrow \qquad n_1 = \frac{\nu}{\lambda_1} = \frac{\nu}{2\ell} \ .$$

Fundamental frequency.

$$\text{Case (ii)} \ \ \ell = \frac{2\lambda_2}{2} \qquad \Rightarrow \qquad \lambda_2 = \frac{2\ell}{2} \qquad \Rightarrow \qquad n_2 = \frac{v}{\lambda_2} = \frac{2v}{2\ell} = 2n_1$$

First overtone frequency.

$$\text{Case (iii)} \ \ \ell = \frac{3\lambda_3}{2} \quad \Rightarrow \qquad \lambda_3 = \frac{2\ell}{3} \qquad \Rightarrow \qquad n_3 = \frac{\nu}{\lambda_3} = \frac{3\nu}{2\ell} = 3n_1 \qquad \quad \text{Second overtone frequency}.$$

Hence frequency of overtones are given by the relation

$$n_1 : n_2 : n_3 \dots = 1 : 2 : 3 \dots$$

If an open pipe and a closed pipe have same length n_{open} = 2 n_{closed}

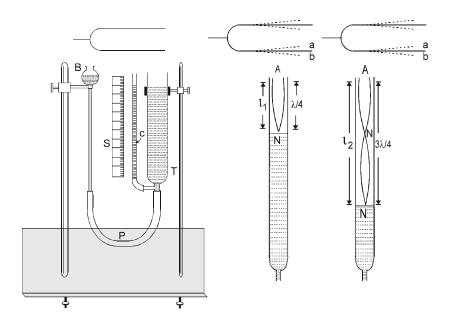

When open organ pipe vibrate in mth overtone then

$$\ell = (m+1)\frac{\lambda}{2} \qquad \text{so} \qquad \lambda = \frac{2\ell}{(m+1)} \quad \Rightarrow \quad n = (m+1)\frac{\nu}{2\ell}$$

5.4 Resonance Tube

Construction: The resonance tube is a tube T (figure) made of brass or glass, about 1 meter long and 5 cm in diameter and fixed on a vertical stand. Its lower end is connected to a water reservoir B by means of a flexible rubber tube. The rubber tube carries a pinch-cock P. The level of water in T can be raised or lowered by water adjusting the height of the reservoir B and controlling the flow of water from B to T or from T to B by means of the pinch-cock P. Thus the length of the air-column in T can be changed. The position of the water level in T can be read by means of a side tube C and a scale S.

Determination of the speed of sound in air by resonance tube

First of all the water reservoir B is raised until the water level in the tube T rises almost to the top of the tube. Then the pinch-cock P is tightened and the reservoir B is lowered. The water level in T stays at the top. Now a tuning fork is sounded and held over the mouth of tube .The pinch-cock P is opened slowly so that the water level in T falls and the length of the air-column increases. At a particular length of air-column in T, a loud sound is heard. This is the first state of resonance. In this position the following phenomenon takes place inside the tube.

$$\ell_1 = \lambda/4$$

$$\ell_2 = 3\lambda/4 \Rightarrow \ell_2 - \ell_1 = \lambda/2 \Rightarrow \lambda = 2(\ell_2 - \ell_1)$$

If the frequency of the fork be n and the temperature of the air-column be $t^{\circ}C$, then the speed of sound at t°C is given by

$$v_{t} = n\lambda = 2n (\ell_{2} - \ell_{1})$$

The speed of sound wave at 0°C

$$v_0 = (v_1 - 0.61 \text{ t}) \text{ m/s}.$$

End Correction: In the resonance tube, the antinode is not formed exactly at the open end but slightly outside at a distance x. Hence the length of the air -column in the first and second states of resonance are $(\ell_1 + x)$ and $(\ell_2 + x)$ then

(i) For first resonance

$$\ell_1 + x = \lambda/4$$
(i)

(ii) For second resonance

$$\ell_2 + x = 3\lambda/4$$
(ii)

Subtract Equation (ii) from Equation (i)

$$\ell_2 - \ell_1 = \lambda/2$$

$$\lambda = 2 (\ell_2 - \ell_1)$$

Put the value of λ in Equation (i) $\ell_1 + x = \frac{2(\ell_2 - \ell_1)}{4}$

$$\Rightarrow \ell_1 + x = \frac{\ell_2 - \ell_1}{2} \Rightarrow x = \frac{\ell_2 - 3\ell_1}{2}$$

5.5 Transverse Stationary wave

Sonometer wire	Plucking dista	nce is x	Overtone	Harmonic	Node	Antinode

Sonometer practical -

- (i) If a vibrating Tuning fork is pressed against a sonometer wire then forced vibrations are produced in table of hollow box & these vibrations are transferred to air coloum filled in hollow box which results into increase in vibration amplitude of sound & intensity of sound increases. Air filled hollow box is called sound box.
- (ii) During contact with table some energy is transferred to table so TF can not do vibrations for longer duration.
- (iii) At resonance maximum energy is transferred to table so TF can do vibrations not for longer duration.
- (iv) At resonance maximum energy is transferred from TF to vibrating wire and sound intensity is maximum.

Frequency corresponding to 'P' loop

$$\boxed{n \ = \ \frac{P}{2\ell}\sqrt{\frac{T}{\pi r^2 d}} \ = \ \frac{P}{2\ell}\sqrt{\frac{T}{Ad}} = \frac{P}{2\ell}\sqrt{\frac{T}{m}} = \frac{P}{2}\sqrt{\frac{T}{M\ell}}} \quad \text{where } m = \frac{M}{\ell}$$

$$n \ \propto \ \frac{1}{\ell} \; ; \; n \; \propto \; \sqrt{T} \; \; ; \; \; n \; \; \propto \; \frac{1}{r} \; \; \label{eq:n_sigma}$$

$$n \propto \frac{1}{\sqrt{A}} \& n \propto \frac{1}{\sqrt{d}}$$

at resonace vibration in rider will be maximum

9810934436, 8076575278, 8700391727

GOLDEN KEY POINTS

Wave property	Reflection	Transmission (Refraction)
V	does not change	changes
n, T, ω	do not change	do not change
λ,k	do not change	change
A, I	change	change
Phase difference ($\Delta \phi$)	$\Delta \phi = 0$, from a rarer medium	does not change
	$\Delta \phi = \pi$, from a denser medium	

- A pulse undergoes a phase change of π on reflection from a rigid boundary.
- A pulse does not suffer any phase change on reflection from a free boundary.
- The transmitted wave is never inverted.
- A rod clamped at one end or a string fixed at one end is similar to vibration of closed end organ pipe.
- A rod clamped in the middle is similar to the vibration of open end organ pipe.
- If an open pipe is half submerged in water, it becomes a closed organ pipe of length half that of open pipe i.e. frequency remains same.
- Due to finite motion of air molecules in organ pipes reflection takes place not exactly at open end but little what above it so in an organ pipe antinode is not formed exactly at free-end but above it at a distance e = 0.6r (called end correction or Rayleigh's correction) with r being the radius of pipe. So for closed organ pipe $L \rightarrow L + 0.6r$ while for open $L \rightarrow L + 2 \times 0.6r$ (as both ends are open)

so that
$$-f_{\rm C} = \frac{v}{4(L+0.6r)}$$
 while $f_{\rm 0} = \frac{v}{2(L+1.2r)}$

This is why for a given v and L narrower the pipe higher will the frequency or pitch and shriller will be the sound.

9810934436, 8076575278, 8700391727

- For an organ pipe (closed or open) if v = constant. $f \propto (1/L)$ So with decrease in length of vibrating air column wavelength decrease ($\lambda \propto L$), frequency or pitch will increase and vice-versa. This is why the pitch increases gradually as an empty vessel fills slowly.
- For an organ pipe if f = constant. $v \propto \lambda$ or $v \propto L$, $f = \frac{v}{\lambda} = \text{constant i.e.}$ the frequency of an organ pipe will remain unchanged if the ratio of speed of sound in to its wave length remains constant.
- As for a given length of organ pipe ℓ = constant $f \propto v$ So
 - (a) With rise in temperature as velocity will increase (v $\propto \sqrt{T}$), the pitch will increase. (Change in length with temperature is not considered unless stated)
 - **(b)** With change in gas in the pipe as v will change and so f will change ($v \propto \sqrt{\gamma/M_w}$)
 - **(c)** With increase in moisture as v will increase and so the pitch will also increase.
- The equation of stationary wave is -
 - (a) When the wave is reflected from a free boundary $y = 2a \cos \frac{2\pi x}{\lambda} \sin \frac{2\pi t}{T}$
 - (b) When the wave is reflected from a rigid boundary $y = -2a\sin\frac{2\pi x}{\lambda}\cos\frac{2\pi t}{T}$
- Nodes are the points on a stationary wave, where the amplitude of oscillating particle is always minimum.
- Antinodes are the points on a stationary wave, where the amplitude of oscillating particle is maximum.
- Only odd harmonics are produced in a closed organ pipe. Moreover, first overtone is the third harmonic, second overtone is the fifth harmonic and so on.
- Both of the odd and even harmonic are produced in open organ pipe. Moreover, here first overtone is the second harmonic, second overtone is the third harmonic and so on.
- If the weight which produces tension in wire is immersed in any liquid, the frequency of vibrating wire decreases.
- If a wire fixed between two ends heat up from its one end, its frequency will increase because of thermal tension produced in it.

 $T=YA\alpha\Delta\theta$ where Y=Young's module, $\alpha=coeff$. of linear expansion, A=cross-section area $\Delta\theta=change$ in temp.

• Echo (Based on reflection) :

 $\label{eq:multiple} \mbox{Multiple reflection of sound is called an echo. If the distance of reflector from the source is d then,} \\ 2d = vt$

Hence, v = speed of sound and t = the time of echo. $\therefore d = \frac{vt}{2}$

Since, the effect of ordinary sound remains on our ear for $1 \setminus 10$ second, therefore, if the sound returns to the starting point before $\frac{1}{10}$ second, then it will not be distinguished from the original sound and no echo will be heard. Therefore, the minimum distance of the reflector is,

$$d_{min} = \frac{v \times t}{2} = \left(\frac{330}{2}\right) \left(\frac{1}{10}\right) = 16.5m$$

Musical Interval

The ratio between the frequencies of two notes is called the musical interval. Following are the names of some

(i) Unison
$$\frac{n_2}{n_1} = 1$$

(ii) Octave
$$\frac{n_2}{n_1} = 2$$

Illustrations

Illustration 24.

Two tuning forks A and B produce 8 beats/s when sounded together. A gas column 37.5 cm long in a pipe closed at one end resonate to its fundamental mode with fork A whereas a column of length 38.5 cm of the same gas in a similar pipe is required for a similar resonance with fork B. Calculate the frequency of these [AIPMT 2006] two tuning forks.

Solution

For tuning fork 'A'
$$\frac{\lambda_1}{4}=37.5$$
 so $n_1=\frac{v}{\lambda_1}=\frac{v}{4\times37.5}$ For tuning fork 'B' $\frac{\lambda_2}{4}=38.5$ \therefore $n_2=\frac{v}{\lambda_2}=\frac{v}{4\times38.5}$

$$\therefore n_1 - n_2 = 8 \Rightarrow \frac{v}{4 \times 37.5} - \frac{v}{4 \times 38.5} = 8 \quad \therefore \quad v = (8 \times 4 \times 37.5 \times 38.5)$$

$$n_1 = \frac{8 \times 4 \times 37.5 \times 38.5}{4 \times 37.5} = 308 \text{ Hz}$$
 and $n_2 = 308 - 8 = 300 \text{ Hz}$

Illustration 25.

A transverse wave, travelling along the positive x-axis, given by y=Asin(kx-\omegat) is superposed with another wave travelling along the negative x-axis given by $y=-A\sin(kx+\omega t)$. The point x=0 is

(1) a node

(2) an anitnode

(3) neither a node nor an antinode

(4) a node or antinode depending on t.

Solution Ans. (2)

At
$$x = 0$$
, $y_1 = A\sin(-\omega t)$ and $y_2 = -A\sin\omega t$; $y_1 + y_2 = -2A\sin\omega t$ (antinode)

Illustration 26.

A standing wave is created on a string of length 120 m and it is vibrating in 6th harmonic. Maximum possible amplitude of any particle is 10 cm and maximum possible velocity will be 10 cm/s. Choose the correct statement.

- (1) Angular wave number of two waves will be $\frac{\pi}{20}$.
- (2) Time period of any particle's SHM will be 4π sec.
- (3) Any particle will have same kinetic energy as potential energy.
- (4) Amplitude of interfering waves are 10 cm each.

Solution Ans. (1)

$$6 \bigg(\frac{\lambda}{2}\bigg) = 120 \Rightarrow \lambda = 40 \Rightarrow k = \frac{\pi}{20} \Rightarrow A\omega = v_{\max} \Rightarrow \omega = 1 \Rightarrow T = 2\pi$$

Illustration 27.

Column I represents the standing waves in air columns and string. Column II represents frequency of the note. Match the column-I with column-II. [v = velocity of the sound in the medium]

	Column-I	Column-II
(A)	Second harmonic for the tube open at both ends	(P) $\frac{v}{4\ell}$
(B)	Fundamental frequency for the tube closed at one end	(Q) $\frac{v}{2\ell}$
(C)	First overtone for the tube closed at one end	(R) $\frac{3v}{4\ell}$
(D)	Fundamental frequency for the string fixed at both ends	(S) $\frac{v}{\ell}$
		$(T) \qquad \frac{5v}{4\ell}$

Solution

Ans. (A) S (B) P (C) R (D) Q

For (A) : For open organ pipe 2nd harmonic =
$$2\left(\frac{v}{2\ell}\right)$$

For (B) : For closed organ pipe fundamental frequency =
$$\frac{v}{4\ell}$$

For (C) : For closed organ pipe, first overtone frequency =
$$\frac{3v}{4\ell}$$

For (D) : For string fixed at both ends, fundamental frequency =
$$\frac{v}{2\ell}$$

Illustration 28.

If an OOP of fundamental frequency 1400 Hz dipped 30% in water then calculate produced frequency.

Solution

$$\frac{v}{2L}$$
 = 1400 Hz $\Rightarrow \frac{v}{L}$ = 2800 Hz

$$n' = \frac{v}{4I'} = \frac{v}{4[0.7L]} = \frac{v}{2.8L} = \frac{2800}{2.8} = 1000 \text{ Hz}$$

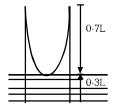

Illustration 29.

Two identical wires under the same tension have a fundamental frequency of 500 Hz. What fractional increase in the tension of one wire will give 5 beats per second?

[AIPMT 2007]

Solution

Let n_1 be the frequency of the wire having tension $T + \Delta T$ and n_2 be the frequency of the wire having tension

T, then
$$\frac{n_1}{n_2} = \sqrt{\frac{T + \Delta T}{T}} = \frac{500 + 5}{500} = \frac{505}{500}$$

$$\Rightarrow \quad \frac{T + \Delta T}{T} \ = \left(1 + \frac{5}{500}\right)^2 \approx \ 1 \ + \ \frac{2}{100} \ \approx \ 1.02 \Rightarrow \frac{\Delta T}{T} \ = \ 0.02$$

OF

For stretched wire frequency $n \propto \sqrt{T} \implies \frac{\Delta n}{n} = \frac{1}{2} \frac{\Delta T}{T}$

$$\Rightarrow \frac{\Delta T}{T} = 2 \left(\frac{\Delta n}{n} \right) = 2 \left(\frac{5}{500} \right) = 0.02$$

Illustration 30.

A string with a mass density of 4×10^{-3} kg/m is under tension of 360 N and is fixed at both ends. One of its resonance frequencies is 375 Hz. The next higher resonance frequency is 450 Hz. Find the mass of the string.

[AIPMT 2007]

Solution

$$\begin{array}{l} n_1 = 375 = \frac{p}{2\ell}\,\sqrt{\frac{T}{m}} \ \ \text{and} \ \ n_2 = 450 = \frac{p+1}{2\ell}\sqrt{\frac{T}{m}} \ \ \text{where p is number of loops} \\ \\ \Rightarrow \quad \frac{450}{375} = \frac{p+1}{p} \Rightarrow p = 5 \\ \\ \text{so} \qquad \ell = \frac{p}{2\times n_1}\sqrt{\frac{T}{m}} = \frac{5}{2\times375}\sqrt{\frac{360}{4\times10^{-3}}} = 2m \ \ \Rightarrow \ \ \text{Mass of wire} = \text{(m) (ℓ)} = \text{(4}\times10^{-3) (2)} = 8\times10^{-3} \ \text{kg} \end{array}$$

OR

Difference between two consecutive resonating frequency $n_2 - n_1 = \frac{1}{2\ell} \sqrt{\frac{T}{m}}$

$$\Rightarrow \quad 450 - 375 = \frac{1}{2\ell} \sqrt{\frac{360}{4 \times 10^{-3}}} \qquad \Rightarrow \quad \ell = \frac{1}{2 \times 75} \sqrt{\frac{360}{4 \times 10^{-3}}} = \frac{1}{150} \times \frac{6 \times 10^2}{2} = 2 \text{ m}$$

$$\Rightarrow \quad \text{Mass of wire = (m) } (\ell) = (4 \times 10^{-3}) (2) = 8 \times 10^{-3} \text{ kg}$$

Illustration 31.

A steel wire of length 1 m and mass 0.1 kg and having a uniform cross-sectional area of 10^{-6} m² is rigidly fixed at both ends. The temperature of the wire is lowered by 20°C. If the wire is vibrating in fundamental mode, find the frequency (in Hz).(Y $_{\text{steel}}$ = 2 $\times10^{11}$ N/m², α_{steel} = 1.21 $\times10^{-5}/^{\circ}\text{C}$)

Solution Ans. (1)

$$\Delta \ell = \alpha \ell \Delta \theta \Rightarrow Y = \frac{T/A}{\Delta \ell/\ell} \Rightarrow T = YA \frac{\Delta \ell}{\ell} \Rightarrow T = \alpha YA\Delta \theta = 48.4N \; ; \; v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{48.4}{\left(\frac{0.1}{1}\right)}} = 22m/s$$

$$\because \text{ for fundamental note } \ell = \frac{\lambda}{2} \Rightarrow \lambda = 2m \Rightarrow f = \frac{v}{\lambda} = \frac{22}{2} = 11 \text{Hz}$$

Illustration 32.

A piezo electric quartz plate of thickness 0.005 m is vibrating in resonant conditions. Calculate its fundamental frequency if for quartz Y = 8×10^{10} N/m² and ρ = 2.65×10^{3} kg/m³

Solution

We know that for longitudinal waves in solids $v = \sqrt{\frac{Y}{\rho}}$, So $v = \sqrt{\frac{8 \times 10^{10}}{2.65 \times 10^3}} = 5.5 \times 10^3 \, \text{m/s}$ Further more for fundamental mode of plate \Rightarrow ($\lambda/2$) = L So λ = 2 x 5 x 10⁻³ = 10⁻² m i.e., $f = (v/\lambda)$ so $f = [5.5 \times 10^3/10^{-2}] = 5.5 \times 10^5 \text{ Hz} = 550 \text{ kHz}$ But as $v = f\lambda$,

Illustration 33.

If a 'COP' is cut into two equal parts then determine frequency of both part. if initially it was 'n'.

Solution
$$n = \frac{V}{4\ell}$$

$$n_1{'} = \frac{V}{2{\left(\frac{\ell}{2}\right)}} = \frac{V}{\ell} = 4{\left(\frac{V}{4\ell}\right)} = 4n \; ; \qquad \qquad n_2 = \frac{V}{4{\left(\frac{\ell}{2}\right)}} = \frac{V}{2\ell} = 2{\left(\frac{V}{4\ell}\right)} = 2n \; ; \qquad \qquad n_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{4\left(\frac{\ell}{2}\right)} = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2\left(\frac{V}{4\ell}\right) = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad \qquad N_2 = \frac{V}{2\ell} = 2n \; ; \qquad N_2 = 2n \;$$

Illustration 34.

For given C.O.P. (closed organ pipe) if 9^{th} O.T. (over tone) has frequency 1900 Hz. then fundamental frequency of same length O.O.P. is ?

Solution

$$19n = 1900$$
; $n = 100$

$$OOP = 2n = 200 Hz$$

For same length OOP have double freq. than COP.

Illustration 35.

Two C.O.P. having length 20 cm & 20.5 cm produce 5 beat/sec determine the freg of both C.O.P.

Solution

$$\frac{n}{n+5} = \frac{20}{20.5}$$
; $n = 200$ For 20.5 cm $n+5=205$ For 20 cm

Illustration 36.

An organ pipe closed at one end vibrating in its first overtone and another pipe, open at both ends vibrating in its third overtone are in resonance with a given tuning fork. The ratio of their lengths are given by

Solution

First Over tone of COP =
$$3\frac{V}{4\ell_C}$$
 and Third Over tone of OOP = $\frac{4V}{2\ell_0}$

according to question boath are equal

$$\therefore 3\frac{V}{4\ell_{\rm C}} = \frac{4V}{2\ell_{\rm 0}} \Rightarrow \frac{\ell_{\rm c}}{\ell_{\rm 0}} = \frac{3}{8}$$

Illustration 37.

A stretched wire of length 114 cm is divide into three segment whose fundamental frequencies are in the ratio 4:3:1, the length of the segments must be in the ratio

Solution

$$n_{_{1}}:n_{_{2}}:n_{_{3}}=4:3:1 \qquad \left[\because n\varpropto\frac{1}{\ell}\right] \Rightarrow \qquad \ell_{_{1}}:\ell_{_{2}}:\ell_{_{3}}=\frac{1}{4}:\frac{1}{3}:1=3:4:12$$

Illustration 38.

A source emits ultrasonic sound of frequency 200 kHz. This sound falls on the water surface. Calculate the wavelength.

(a) in the reflected sound (b) in the transmitted sound velocity of sound in air = $340~\text{ms}^{-1}$, velocity of sound in water = $1480~\text{ms}^{-1}$)

Solution

Wave length
$$\lambda = \frac{\text{Velocity}}{\text{Frequency}}$$

(a) Reflected sound travels in air so
$$\lambda = \frac{340}{200 \times 10^3} = 1.7 \times 10^{-3} \text{ m}$$

(b) Transmitted sound travels in water so
$$\lambda = \frac{1480}{200 \times 10^3} = 7.4 \times 10^{-3} \, \text{m}$$

BEGINNER'S BOX-5

- The equation of progressive wave is $y = 0.09 \sin 8\pi [t (x/20)]$ after reflection of this wave from rigid end the amplitude of reflected wave becomes 2/3 of initial then (i) Find the equation of reflected wave (ii) Find the displacement of that particle which is situated at x = 0, in reflected wave.
- 2. A string vibrate according to the equation $y = 5 \sin \left(\frac{\pi x}{3}\right) \cos (40\pi t)$ where x and y are in centimeters and t is in seconds.
 - (a) What is the equation of incident and reflected wave?
 - (b) What is the distance between the adjacent nodes?
 - (c) What is the velocity of the particle of the string at the position x = 1.5 cm when $t = \frac{9}{8}$ sec?
- **3.** The transverse displacement of a string is given by

$$y(x, t) = 0.06 \sin\left(\frac{2\pi}{3}x\right) \cos(120\pi t)$$

where x and y are in m and t in s. The length of the string is 1.5m and its mass is 3.0×10^{-2} kg. Answer the following :

- (a) Does the function represent a travelling wave or a stationary wave?
- (b) What are the wavelength, frequency, and speed of each wave?
- (c) Determine the tension in the string.
- **4.** For a plane progressive wave : $y = 0.02 \sin 2\pi (330t x)$
 - (i) If this wave is reflected from rigid end and amplitude becomes 60% of initial then equation of wave will be?
 - (ii) If this wave is reflected from free end and amplitude becomes 75% of initial then equation of wave will be?
- A progressive wave the equation is $y = 0.08 \sin 2\pi (200t x)$ it is reflected from rigid end and amplitude becomes half then equation of reflected wave and if it is reflected from free end then equation of reflected wave is .
- **6.** An organ pipe produces a sound of frequency 400 Hz. If it is blown a little harder then it produces a sound of frequency 800 Hz. It is an open pipe or a closed pipe?
- **7.** If a stretched string which is fixed at both ends has m nodes, then calculate its length.
- **8.** A 20 cm long pipe is closed at one end. Which harmonic mode of the pipe is resonantly excited by 425Hz source? Will the same source be in resonance with the pipe if both ends are open? (Speed of sound in air = 340 m/s)
- 9. If frequency of third overtone of closed organ pipe is equal to frequency of sixth overtone of an open organ pipe, then determine their length ratio $\frac{\ell_c}{\ell}$.
- 10. A sonometer wire emits a fundamental note of frequency 150 Hz. Calculate the frequency of the note emitted when the tension is changed in the ratio of 9:16 and length in the ratio of 1:2.
- 11. Third overtone of a closed organ pipe is in unison with fourth harmonic of an open organ pipe. find the ratio of lengths of the pipes.
- **12.** Two successive resonant frequencies in an open organ pipe are 1944 and 2592 Hz. If the speed of sound in air 324 ms⁻¹, then find the length of tube.

- **13.** Given below are some functions of x and t to represent the displacement (transverse or longitudinal) of an elastic wave. State which of these represent (i) a travelling wave, (ii) a stationary wave or (iii) none at all:
 - (a) $y = \cos(3x) \sin(10t)$

(b)
$$y = 2\sqrt{x - vt}$$

(c)
$$y = 3 \sin(5x - 0.5t) + 4 \cos(5x - 0.5t)$$

- (d) $y = \cos x \sin t + \cos 2x \sin 2t$
- **14.** If OOP have 10 antinodes and fundamental freq. 300 Hz. then freq at 10th Antinode.
- **15.** The sum of frequencies of COP's first overtone and OOP's second overtone is 180 find fundamental frequencies of COP and OOP. (length is same)
- **16.** A tuning fork produce four beats per second with two OOP's having length 30 & 31 cm find the freq. of T.F.
- 17. A tuning fork is found to give 20 beats in 12 seconds when sounded in conjuction with a stretched string vibrating under a tension of 14.4 or 10 kgf. Calculate the frequency of the fork.
- **18.** Two tuning fork n_1 , n_2 produce two beats per sec. n_1 resonant with 15 cm COP and n_2 resonant with 30.5 cm OOP. Find the freq. of $n_1 \& n_2$.
- 19. A tube 1 m long is closed at one end. A stretched wire is placed near the open end. The wire is 0.3m long and has a mass of 0.01kg. It is held fixed at both ends and vibrates in its fundamental mode. It sets the air column in the tube into vibration at its fundamental frequency by resonance. Find
 - (a) the frequency of oscillation of the air column.
 - (b) the tension in the wire, If speed of sound in air is 330 m/s.
- **20.** In resonance tube experiment if V = 300 m/s, n = 500 Hz., L = 125 cm
 - (i) Find out maximum order of resonance that can be established?
 - (ii) Maximum number of resonance?
 - (iii) Maximum & minimum water level kept at resonance condition?
- **21.** If we increase the tension of streached wire by 5 kg. wt. then fundamental freq increase with ratio of 2:3 find the initial tension.
- 22. Fill in the blanks for COP and OOP.
 - (i) In COP if the freq of 7th overtone is 600 Hz then fundamental frequency of COP is.......
 - (ii) In COP if the frequency of 3^{rd} overtone is 1400 Hz then fundamental frequency of same length OOP is........
 - (iii) In OOP if the frequency of 7th overtone is 800 Hz then fundamental frequency of OOP is.......
 - (iv) In COP if the frequency of 7th overtone is 600 Hz then frequency of 3rd overtone is.......
 - (v) In OOP if the frequency of 7^{th} overtone is 1600 Hz then frequency of 3^{rd} overtone is........
 - (vi) In OOP if the frequency of 7th overtone is 1600 Hz then fundamental frequency of same length COP is........
 - (vii) In OOP if the frequency of 7th overtone is 800 Hz then frequency of OOP corresponding to first overtone is.......
 - (viii) Length of OOP is 44 cm speed of sound 340 m/s fundamental frequency is 340 Hz then value of end correction is........
 - (ix) Length of OOP is 38 cm speed of sound 340 m/s fundamental frequency is 340 Hz then value of radius of pipe is........

23. Fill in the blanks for Sonometer.

- (i) In sonometer if tension of wire and length of wire becomes double and mass per unit length of wire remain constant then fundamental frequency of wire will becomes........
- (ii) In sonometer if tension of wire and length becomes double and mass of wire remain constant then fundamental frequency of wire will becomes.......
- (iii) In sonometer if tension of wire and length becomes double and mass per unit length remain constant then wave velocity will becomes........
- (iv) In a stretched wire calculate speed of wave if tension in wire is 40 N and mass for unit length is 4×10^{-3} kg/m.
- (v) In a stretched wire calculate speed of wave in wire if tension in wire is 80 N and mass is $4 \times 10^{-3} \text{ kg}$. and length of wire is 2 m.........
- **(vi)** In sonometer, if tensions and length both becomes four times, taking mass per unit length constant then, for vibration of same frequency Tunning fork, Number of loop will becomes.......

24. Fill in the blanks for Resonance tube.

- (i) In resonance tube first resonanting length is 25 cm then its second resonanting length will be (if e = 0)
- (ii) In resonance tube first resonanting length is 25 cm then its second resonanting length will be (if $e \neq 0$)
- (iii) Length of resonance tube is 140 cm. How many resonance are possible for wave have wave length 40 cm.
- (iv) Length of resonance tube is 150 cm. How many resonance are possible for wave having frequency 400 Hz and speed of sound 320 m/s...........
- (v) Length of resonance tube is 150 cm. Maximum level of liquid, in resonance candition for wave having wavelength 80 cm. is.......
- (vi) Length of resonance tube is 150 cm Minimum level of liquid, in resonance candition for wave having wavelength 80 cm. is.......
- **(vii)** In resonance tube first resonanting length is 17 cm, second resonanting length is 55 cm then wavelength of wave is.......
- (viii) In resonance tube first resonanting length is 17 cm, second resonanting length is 55 cm then radius of tube is

6. DOPPLER EFFECT IN SOUND WAVES AND LIGHT WAVES

6.1 Acoustic Doppler Effect (Doppler Effect for Sound Waves)

The apparent change in frequency or pitch due to relative motion of source and observer along the line of sight is called Doppler Effect.

While deriving these expressions, we make the following assumptions:

- (i) The velocity of the source, the observer and the medium are along the line joining the positions of the source and the observer.
- (ii) The velocity of the source and the observer is less than velocity of sound.

Doppler effect takes place both in sound and light. In sound it depends on whether the source or observer or both are in motion while in light it depends on whether the distance between source and observer is increasing or decreasing.

NOTATIONS

 $n \rightarrow actual frequency$ $n' \rightarrow observed frequency (apparent frequency)$

 λo actual wave length $\lambda' o$ observed (apparent) wave length

 $v \rightarrow \text{ velocity of sound } \qquad \qquad v_s \rightarrow \text{ velocity of source}$

 $v_0 \rightarrow velocity$ of observer $v_w \rightarrow wind velocity$

Case I: Source in motion, observer at rest, medium at rest:

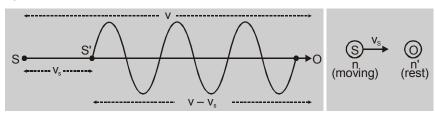

Suppose the source S and observer O are separated by distance v. Where v is the velocity of sound. Let n be the frequency of sound emitted by the source. Then n waves will be emitted by the source in one second. These n waves will be accommodated in distance v.

So, wave length
$$\lambda = \frac{total\ distance}{total\ number\ of\ waves} = \frac{v}{n}$$

(1) Source moving towards stationary observer:

Let the source start moving towards the observer with velocity v_s . After one second, the n waves will be crowded in distance $(v-v_s)$. Now the observer shall feel that he is listening to sound of wavelength λ' and frequency n'

Now apparent wavelength

$$\lambda' = \frac{\text{total distance}}{\text{total number of waves}} = \frac{v - v_s}{n}$$

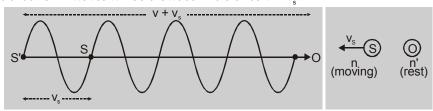

and changed frequency,

$$n' = \frac{v}{\lambda'} = \frac{v}{\left(\frac{v - v_s}{n}\right)} = n\left(\frac{v}{v - v_s}\right)$$

So, as the source of sound approaches the observer the apparent frequency n' becomes greater than the true frequency n.

(2) When source move away from stationary observer:

For this situation n waves will be crowded in distance $v + v_s$.

So, apparent wavelength $\lambda' = \frac{v + v_s}{n}$:

and apparent frequency,
$$n' = \frac{v}{\lambda'} = \frac{v}{\left(\frac{v + v_s}{n}\right)} = n\left(\frac{v}{v + v_s}\right)$$

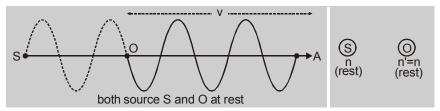

So, n' becomes less than n. (n' < n)

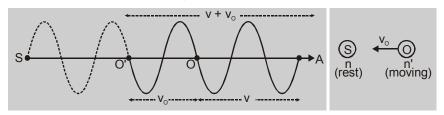

Case II:

Observer in motion, source at rest, medium at rest:-

Let the source (S) and observer (O) are in rest at their respective places. Then n waves given by source 'S' would be crossing observer 'O' in one second and fill the space OA (=v)

(1) Observer move towards stationary source :-

When observer 'O' moves towards 'S' with velocity v_o , it will cover v_o distance in one second. So the observer has received not only the n waves occupying OA but also received additional number of Δn waves occupying the distance OO' (= v_o).

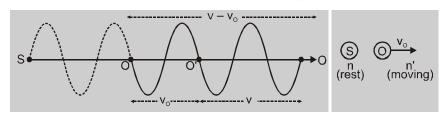

So, total waves received by observer in one second

i.e., apparent frequency (n') = Actual waves (n) + Additional waves (Δn)

$$n' = \frac{v}{\lambda} + \frac{v_o}{\lambda} = \frac{v + v_o}{(v/n)} = n \left(\frac{v + v_o}{v} \right) \qquad \left(\because \quad \lambda = \frac{v}{n} \right)$$
 (so, n' > n)

(2) Observer move away from stationary source :-

For this situation n waves will be crowded in distance $v - v_0$.

When observer move away from source with v_o velocity then he will get Δn waves less than real number of waves. So, total number of waves received by observer i.e.,

Apparent frequency $(n') = Actual waves (n) - reduction in number of waves (<math>\Delta n$)

$$n' = \frac{v}{\lambda} - \frac{v_{\circ}}{\lambda} = \frac{v - v_{\circ}}{\lambda} = \frac{v - v_{\circ}}{(v/n)} = \left(\frac{v - v_{\circ}}{v}\right) n \quad \left(\because \quad \lambda = \frac{v}{n}\right) \quad (so \ n' < n)$$

Case III:

Effect of motion of medium:-

General formula for doppler effect =
$$n' = n \left[\frac{v \pm v_o}{v \mp v_s} \right]$$
 ...(i)

If medium (air) is also moving with v_m velocity in direction of source and observer. Then velocity of sound relative to observer will be $v \pm v_m$ (-ve sign, if v_m is opposite to sound velocity). So,

$$n' = n \left(\frac{v \pm v_m \pm v_o}{v \pm v_m \mp v_s} \right)$$
 [On replacing v by $v \pm v_m$ in equation (i)]

Note :- When both 'S' and 'O' are in rest (i.e. $v_s = v_o = 0$) then there is no effect on frequency due to motion of air.

SPECIAL CASES

Case-I If medium moves in a direction opposite to the direction of propagation of sound, then

$$n' = \left(\frac{v - v_m \pm v_O}{v - v_m \pm v_S}\right) n$$

Case-II Source in motion towards the observer. Both medium and observer are at rest.

$$n' = \left(\frac{v}{v - v_s}\right) n; \text{ Clearly } n' > n$$

So, when a source of sound approaches a stationary observer, the apparent frequency is more than the actual frequency.

Case-III Source in motion away from the observer. Both medium and observer are at rest.

$$n' = \left(\frac{v}{v + v_s}\right) n \; ; \; \text{Clearly } n' < n$$

So, when a source of sound moves away from a stationary observer, the apparent frequency is less than actual frequency.

Case-IV Observer in motion towards the source. Both medium and source are at rest.

$$n' = \left(\frac{v + v_0}{v}\right)n$$
; Clearly $n' > n$

So, when observer is in motion towards the source, the apparent frequency is more than the actual frequency.

Case-V Observer in motion away from the source. Both medium and source are at rest.

$$n' = \left(\frac{v - v_O}{v}\right) n \; ; \quad \text{ Clearly } \qquad n' < n$$

So, when observer is in motion away from the source, the apparent frequency is less than the actual frequency.

Case-VI Both source and observer are moving away from each other. Medium at rest.

$$n' = \left(\frac{v - v_O}{v + v_S}\right) n; \quad \text{Clearly} \quad n' > n$$

6.2 Doppler's effect in reflection of sound (echo)

When the sound is reflected from the reflector the observer receives two notes one directly from the source and other from the reflector. If the two frequencies are different then superposition of these waves result in beats and by the beat frequency we can calculate speed of the source.

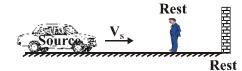

Case-I

When source moves towards stationary target.

 n'_{D} = direct apparent frequency

n' = apparent frequency at reflector

 n'_{R} = reflected apparent frequency

$$\vec{n}_D = \left(\frac{V}{V - V_S}\right) n$$

$$\mathbf{Rest} \qquad \mathbf{n_D'} = \left(\frac{\mathbf{V}}{\mathbf{V} - \mathbf{V_S}}\right) \mathbf{n}$$

$$\mathbf{r'} = \left(\frac{\mathbf{V}}{\mathbf{V} - \mathbf{V_S}}\right) \mathbf{n}$$

$$n'_R = n'$$

$$b = \Delta n = n'_R - n'_D = 0$$

$$n_{D}^{'} = \left(\frac{V}{V + V_{S}}\right) n$$

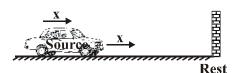

$$n' = \left(\frac{V}{V - V_S}\right) n$$

$$b = \Delta n = \left(\frac{V}{V - V_S} - \frac{V}{V + V_S}\right) n = \frac{2V_S V n}{V^2 - V_S^2} \cong \left(\frac{2V_S}{V}\right) n$$

Note Stationary target behave as an observer for incident sound and behave as a source for reflected sound.

Case-II

When source and observer both move towards statonary target.

$$n_D' = n$$

$$\mathbf{n}_{\mathrm{D}} = \mathbf{n},$$

$$\mathbf{Rest} \qquad \mathbf{n}' = \left(\frac{\mathbf{V}}{\mathbf{V} - \mathbf{x}}\right) \mathbf{n}$$

$$n_{R}^{'} = \left(\frac{V+x}{V}\right)n' = \left\lceil \frac{V+x}{V} \right\rceil \left\lceil \frac{V}{V-x} \right\rceil n$$

$$n_{R} = \left(\frac{V + x}{V - x}\right) n$$

$$b = n_R - n_D = \left(\frac{V+x}{V-x}\right) n - n \Rightarrow b = \frac{2x}{V-x}n$$

CONDITIONS WHEN DOPPLER'S EFFECT IS NOT OBSERVED FOR SOUND WAVES

- 1. When the source of sound and observer both are at rest then doppler effect is not observed.
- 2. When the source and observer both are moving with same velocity in same direction.
- 3. When the source and observer are moving mutually in perpendicular directions.
- 4. When the medium only is moving.
- 5. When the distance between the source and observer is constant.

6.3 Doppler effect in light:

Doppler effect holds also for EM waves. As speed of light is independent of relative motion between source and observer, the formulae are different from that of sound. Here when either source or observer (detector) or both are in motion, only two cases are possible (approach or recession)

Doppler's effect in light is symmetrical (unlike sound). It means the observer moving towards the source at a particular speed will produce the same frequency change as the source moving towards the observer at the same speed.

$$\text{In case of approach} \qquad \qquad n' = n \left(\frac{1 + \frac{v}{c}}{1 - \frac{v}{c}} \right)^{\frac{1}{2}} \qquad \text{and} \qquad \lambda' = \lambda \left(\frac{1 - \frac{v}{c}}{1 + \frac{v}{c}} \right)^{\frac{1}{2}}$$

$$\text{In case of recession} \qquad \quad n' = n \left(\frac{1 - \frac{v}{c}}{1 + \frac{v}{c}} \right)^{\frac{1}{2}} \qquad \text{and} \qquad \lambda' = \lambda \left(\frac{1 + \frac{v}{c}}{1 - \frac{v}{c}} \right)^{\frac{1}{2}}$$

If v << c then in case of approach $\,n^{\,\prime}\approx n \Bigg(1+\frac{v}{c}\Bigg)$ in case of recession $\,n^{\,\prime}\approx n \Bigg(1-\frac{v}{c}\Bigg)$

So at low speeds doppler effect in light and sound is governed by the same formula.

DOPPLER'S SHIFT:

When radiation coming from distant stars are analysed by radio telescopes and compared with their natural radiation wavelength focussed on mean wavelength on a visible spectrum, it is observed that coming radiation has a shift towards red or violet end.

$$\text{Red shift} \hspace{1cm} \Delta \lambda = \lambda \, ' - \lambda = \left(\frac{v}{c} \right) \! \lambda \hspace{1cm} \Rightarrow \hspace{1cm} \Delta \lambda = \frac{v}{c} \lambda$$

$$\mbox{Violet shift (or blue shift)} \qquad \Delta \lambda = \lambda' - \lambda = - \bigg(\frac{v}{c} \bigg) \lambda \qquad \Rightarrow \qquad \Delta \lambda = - \frac{v}{c} \lambda$$

In case of approach frequency increases while wavelength decreases i.e. shift $\Delta\lambda$ is towards violet end of the spectrum while in case of recession frequency decreases and wavelength increases i.e. shift $\Delta\lambda$ is towards red end.

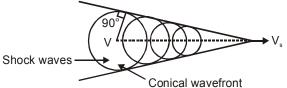

GOLDEN KEY POINTS

$\Delta n = \frac{2V_S}{V}(n_0)$	$\Delta v = \frac{2V_{R}}{C}(v_{o})$

Shock waves: - A body moving with a supersonic velocity leaves behind itself a conical disturbance region.
 Disturbance of this kind is called a shock wave. These have a large amount of energy which can damage the buildings.

$$sin\,\theta = \frac{V}{V_S} = \frac{1}{Mach\,number}$$

 2θ = cone angle.

Generally mach number remain less than one.

Illustrations

Illustration 39.

Two tuning forks A and B lying on opposite sides of observer 'O' and of natural frequency $85 \, \text{Hz}$ move with velocity $10 \, \text{m/s}$ relative to stationary observer O. Fork A moves away from the observer while the fork B moves towards him. A wind with a speed $10 \, \text{m/s}$ is blowing in the direction of motion of fork A. Find the beat frequency measured by the observer in Hz. [Take speed of sound in air as $340 \, \text{m/s}$]

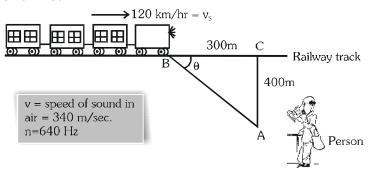

Solution Ans. (1)

$$f_{\text{observer for source 'A'}} = f_0 \left[\frac{v_{\text{sound}} - v_{\text{medium}}}{v_{\text{sound}} - v_{\text{medium}} + v_{\text{source}}} \right] = \frac{33}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}} - v_{\text{source}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}} - v_{\text{source}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}} - v_{\text{source}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}} - v_{\text{source}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{observer for source 'B'}} = f_0 \left[\frac{v_{\text{sound}} + v_{\text{medium}}}{v_{\text{sound}} + v_{\text{medium}}} \right] = \frac{35}{34} f_0 \; ; \; f_{\text{sound}} + v_{\text{medium}} = \frac{35}{34} f_0 \; ; \; f_{\text{sound}} + v_{\text{medium}} = \frac{35}{34} f_0 \; ; \; f_{\text{sound}} + v_{\text{medium}} = \frac{35}{34} f_0 \; ; \; f_{\text{sound}} = \frac{35}{34} f_0 \; ; \; f_{\text{so$$

$$\therefore \ \, \text{Beat frequency} = f_1 - f_2 = \left(\frac{35 - 33}{34}\right) f_0 = 5$$

Illustration 40.

If engine of train produce horn at B point then find apparent frequency observed by observer at A point.

Solution

$$\begin{aligned} &n' = \left(\frac{v}{v - v_s \cos \theta}\right) n \; ; \; \text{Direction in AB velocity} = v_s \cos \theta \; = \left[120 \times \frac{5}{18}\right] \times \cos \theta = 120 \times \frac{5}{18} \times \frac{3}{5} \; = \; 20 \; \text{m/sec.} \end{aligned}$$

$$\Rightarrow n' = \left(\frac{340}{340 - 20}\right) \times 640 = 680 \; \text{Hz.}$$

Illustration 41.

A train, standing in a station-yard, blows a whistle of frequency 400 Hz in still air. The wind starts blowing in the direction from the yard to the station with at a speed of 10 ms^{-1} . What are the frequency, wavelength, and speed of sound for an observer standing on the station's platform? Is the situation exactly identical to the case when the air is still and the observer runs towards the yard at a speed of 10 ms^{-1} ? The speed of sound in still air can be taken as 340 ms^{-1} .

Solution

Here source and observer both are at rest when wind starts blowing from source to observer then effecting velocity of sound, $v_{sound} = v + v_m = 340 + 10 = 350 \text{ ms}^{-1}$

Since there is no relative motion between source and observer therefore frequency remains the same i.e. $400\,\mathrm{Hz}$.

Now wave length
$$\lambda = \frac{v_{sound}}{n} = \frac{350}{400} = 0.875 \text{ m}$$

The two situations are not exactly identical, because in second case medium is at rest, while observer in motion.

Illustration 42.

A SONAR system fixed in a submarine operates at a frequency $40.0 \, \text{kHz}$. An enemy submarine moves towards the SONAR with a speed of $360 \, \text{km h}^{-1}$. What is the frequency of sound reflected by the submarine? Take the speed of sound in water to be $1450 \, \text{ms}^{-1}$.

Solution

As the sound is observed by enemy subsmarine.

Here observer (enemy submarine) is moving towards the source (SONAR)

$$\therefore \text{ Apparent frequency n'} = \left(\frac{v + v_0}{v - v_s}\right) n = \left(\frac{1450 + 100}{1450}\right) \times 40 \times 10^3 = \frac{1550}{1450} \times 40 \times 10^3 \text{ Hz}$$

After the sound is reflected, enemy submarine acts. as a source of frequency n'. This source moves with a speed of $100~\rm ms^{-1}$ towards the observer (SONAR)

:. Apparent frequency of sound reflected by the enemy submarine

$$n'' = \left(\frac{v - v_0}{v - v_0}\right) n' = \left(\frac{1450 - 0}{1450 - 100}\right) \times \left(\frac{1550}{1450} \times 40 \times 10^3\right) = 45.93 \text{ kHz}$$

Illustration 43.

Two trains travelling in opposite directions at 126 km/hr each, cross each other while one of them is whistling. If the frequency of the note is 2.22 kHz find the apparent frequency as heard by an observer in the other train:

(a) Before the trains cross each other, (b) After the trains have crossed each other. ($v_{sound} = 335 \, \text{m/sec}$) **Solution**

Here
$$v_1 = 126 \times \frac{5}{18} = 35 \text{ m/s}$$

(i) In this situation
$$0 \longrightarrow V_1$$
 $V_1 \longleftarrow 0$

Observed freq
$$n' = \left(\frac{v + v_1}{v - v_1}\right) \times n = \left(\frac{335 + 35}{335 - 35}\right) \times 2220 = 2738 \text{ Hz}$$

(ii) In this situation
$$v_1 \leftarrow 0$$
 $0 \rightarrow v_1$

Observed freq
$$n' = \left(\frac{v - v_1}{v + v_1}\right) \times n = \left(\frac{335 - 35}{335 + 35}\right) \times 2220 = 1800 \text{ Hz}$$

Illustration 44.

A star which is emitting radiation at a wavelength of 5000 Å, is approaching the earth with a velocity of 1.5×10^3 m/s. Calculate the change in wavelength of the radiation as received by the earth.

Solution

$$\Delta \lambda = \frac{v}{c} \lambda = \frac{1.5 \times 10^3}{3 \times 10^8} \times 5000 = 0.025 \text{Å}$$

Illustration 45.

A person going away from a factory on his scooter at a speed of 36 km/hr listens to the siren of the factory. If the actual frequency of the siren is 700 Hz and a wind is blowing along the direction of the scooter at 36 km/hr, find the observed frequency heard by the person. (Given speed of sound = 340 m/s)

Solution

In this situation
$$\begin{aligned} n' &= \left(\frac{v+w-v_0}{v+w}\right)n \\ where &\quad w &= v_0 = 36 \text{ km/hr} = 10\text{m/s} \\ n' &= \left(\frac{340+10-10}{340+10}\right) \times 700 = \frac{340}{350} \times 700 = 680\text{Hz} \end{aligned}$$

BEGINNER'S BOX-6

- 1. A bat is flitting about in a cave, navigating via ultrasonic bleeps. Assume that the sound emission frequency of the bat is 40 kHz. During one fast swoop directly toward a flat wall surface, the bat is moving at 0.03 times the speed of sound in air. What frequency does the bat hear reflected off the wall?
- **2.** A railway engine moving with a speed of 60 m/s passes a stationary listener. The real frequency of its whistle is 400 Hz. Calculate the apparent frequency heard by the listener.
 - (a) When the engine is approching the listener.
 - (b) When the engine is moving away from the listener. (velocity of sound = 340 m/s)
- 3. A stationary source emits sound of frequency 1200 Hz. If wind blows at the speed of 0.1v, deduce
 - (a) the change in the frequency for a stationary observer on the wind side of the source.
 - (b) Report the calculations for the case when there is no wind but the observer moves at 0.1v speed towards the source. (given: velocity of sound = v)
- **4.** A car has two horns having a difference in frequency of 180 Hz. The car is approaching a stationary observer with a speed of 60 ms⁻¹. Calculate the difference in frequencies of the notes as heard by the observer, if velocity of sound in air is 330 ms⁻¹.
- **5.** When both source and observer approach each other with a speed equal to the half the speed of sound, then determine the percentage change in frequency of sound as detected by the listener.

EXERCISE-I (Conceptual Questions)

WAVE AND ITS CHARACTERISTICS

- **1.** Water waves are of the nature :
 - (1) Transverse
 - (2) Longitudinal
 - (3) Sometimes longitudinal and some times transverse and longitudinal both
 - (4) Neither transverse nor longitudinal
- **2.** Sound wave are not polarized because :
 - (1) Their speed is less
 - (2) A medium is needed for their propagation
 - (3) These are longitudinal
 - (4) Their speed depands on temperature
- **3.** A thunder tap is heared 5.5 second after the lightening flash. The distance of the flash is (velocity of sound in air is 330 m/sec.) :-
 - (1) 3560 m
- (2) 300 m
- (3) 1780 m
- (4) 1815 m
- 4. Transverse waves can propagate
 - (1) only in solids
 - (2) both in solids and gases
 - (3) neither in solids nor in gases
 - (4) only in gases
- 5. Transverse elastic waves can be propagate in
 - (1) Both solid & gas
 - (2) In solid but not gas
 - (3) Neither solid nor gas
 - (4) None
- 6. A wave of frequency 500 Hz travels between X and Y and travel a distance of 600 m in 2 sec. between X and Y. How many wavelength are there in distance XY:
 - (1) 1000
- (2) 300
- (3) 180
- (4) 2000
- 7. If at a place the speed of a sound wave of frequency 300 Hz is V, the speed of another wave of frequency 150 Hz at the same place will be:
 - (1) V

- (2) V/2
- (3) 2V
- (4) 4V

8. The equation of a progressive wave for a wire is:

$$Y = 4 \sin \left[\frac{\pi}{2} \left(8t - \frac{x}{8} \right) \right]. \text{ If } x \text{ and } y \text{ are measured}$$

in cm then velocity of wave is:

- (1) 64 cm/s along x direction
- (2) 32 cm/s along x direction
- (3) 32 cm/s along + x direction
- (4) 64 cm/s along + x direction
- 9. The equation of progressive wave is

$$Y = 4 \sin \left\{ \pi \left(\frac{t}{5} - \frac{x}{9} \right) + \frac{\pi}{6} \right\} \text{ where } x \text{ and } y \text{ are }$$

in cm. Which of the following statement is true?

- (1) $\lambda = 18$ cm
- (2) amplitude=0.04 cm
- (3) velocity v = 50 cm/s
- (4) frequency f = 20 Hz
- **10.** A plane progressive wave is respresented by the equation $y = 0.25 \cos (2\pi t 2\pi x)$.

The equation of a wave is with double the amplitude and half frequency but travelling in the opposite direction will be.

- (1) $y = 0.5 \cos(\pi t \pi x)$
- (2) $y = 0.5 \cos(2\pi t + 2\pi x)$
- (3) $y = 0.25 \cos(\pi t + 2\pi x)$
- (4) $y = 0.5 \cos(\pi t + \pi x)$
- 11. A plane wave is described by the equation

$$y = 3\cos\left(\frac{x}{4} - 10t - \frac{\pi}{2}\right)$$
. The maximum velocity of

the particles of the medium due to this wave is

- (1) 30
- (2) $\frac{3\pi}{2}$
- (3) 3/4
- (4) 40
- **12.** The equation $y = 4 + 2 \sin (6t 3x)$ represents a wave motion with
 - (1) amplitude 6 units
 - (2) amplitude 4 units
 - (3) wave speed 2 units
 - (4) wave speed 1/2 units

13. The equation of a progressive wave are

$$Y = sin \Bigg[200\pi \Bigg(t - \frac{x}{330} \Bigg) \Bigg]$$
 , where x is in meter and

f is in second. The frequency and velocity of wave are

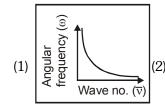

- (1) 100 Hz, 5 m/s
- (2) 300 Hz, 100 m/s
- (3) 100 Hz, 330 m/s
- (4) 30 m/s, 5 Hz
- **14.** Due to propagation of longitudinal wave in a medium, the following quantities also propagate in the same direction :
 - (1) Energy, Momentum and Mass
 - (2) Energy
 - (3) Energy and Mass
 - (4) Energy and Linear Momentum
- **15.** The waves in which the particles of the medium vibrate in a direction perpendicular to the direction of wave motion is known as:
 - (1) transverse waves
 - (2) propagated waves
 - (3) longitudinal waves
 - (4) stationary waves
- **16.** Two wave are represented by equation

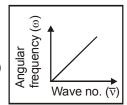

$$y_1 = a \sin \omega t$$
 $y_2 = a \cos \omega t$

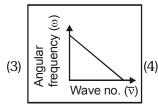

the first wave -

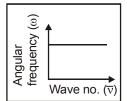

- (1) leads the second by π
- (2) lags the second by π
- (3) leads the second by $\frac{\pi}{2}$
- (4) lags the second by $\frac{\pi}{2}$
- 17. The distance between two consecutive crests in a wave train produced in string is 5 m. If two complete waves pass through any point per second, the velocity of wave is
 - (1) 2.5 m/s
- (2) 5 m/s
- (3) 10 m/s
- (4) 15 m/s

18. The graph between wave number ($_{V}$) and angular frequency ($_{\Omega}$) is :

- **19.** The waves produced by a motorboat sailing on water are
 - (1) Transverse
 - (2) Longitudinal
 - (3) Longitudinal and Transverse
 - (4) Stationary

PROGRESSIVE WAVE ON STRING

- **20.** In a string the speed of wave is 10 m/s and its frequency is 100 Hz. The value of the phase difference at a distance 2.5 cm will be:
 - (1) $\pi/2$
- (2) $\pi/8$
- (3) $3\pi/2$
- $(4) 2\pi$
- **21.** A uniform rope of mass 0.1 kg and length 2.5 m hangs from ceiling. The speed of transverse wave in the rope at upper end and at a point 0.5 m distance from lower end will be:
 - (1) 5 m/s, 2.24 m/s
 - (2) 10 m/s, 3.23 m/s
 - (3) 7.5 m/s, 1.2 m/s
 - (4) 2.25 m/s, 5 m/s
- **22.** The equation of a wave on a string of linear density 0.04 kg m^{-1} is given by

$$y = 0.02 (m) sin \Bigg[2\pi \Bigg(\frac{t}{0.04 (s)} - \frac{x}{0.50 (m)} \Bigg) \Bigg].$$

The tension in the string is:

- (1) 6.25 N
- (2) 4.0 N
- (3) 12.5 N
- (4) 0.5 N

23. The mathematical forms for three sinusoidal travelling waves are given by

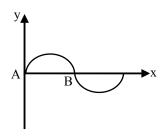

Wave $1 : y(x,t) = (2cm) \sin(3x-6t)$

Wave 2 : $y(x,t) = (3cm) \sin(4x-12t)$

Wave 3: $v(x,t) = (4cm) \sin(5x-11t)$

where \boldsymbol{x} is in meters and t is in seconds. Of these waves :

- (1) wave 1 has the greatest wave speed and the greatest maximum transverse string speed.
- (2) wave 2 has the greatest wave speed and wave 1 has the greatest maximum transverse string speed.
- (3) wave 3 has the greatest wave speed and the greatest maximum transverse string speed.
- (4) wave 2 has the greatest wave speed and wave 3 has the greatest maximum transverse string speed.
- **24.** The figure shows an instantaneous profile of a rope carrying a progressive wave moving from left to right, then

- (a) the phase at A is greater than the phase at B
- (b) the phase at B is greater than the phase at A
- (c) A is moving upwards
- (d) B is moving upwards
- (1) a & c

(2) a & d

(3) b & c

(4) b & d

25. Linear density of a string is 1.3×10^{-4} kg/m and wave equation is $y = 0.021\sin(x + 30t)$. Find the tension in the string where x in meter, t in sec.

(1) $1.17 \times 10^{-2} \text{ N}$

(2) $1.17 \times 10^{-1} \,\mathrm{N}$

(3) $1.17 \times 10^{-3} \text{ N}$

(4) None

SOUND WAVES AND ITS CHARACTERISTICS

- **26.** The speed of sound in air at constant temperature
 - (1) is proportional to the atmospheric pressure.
 - (2) is proportional to the square of atmospheric pressure.
 - (3) is propertional to the square root of atmospheric pressure
 - (4) does not depend on atmospheric pressure.
- **27.** At the room temperature the velocity of sound in O_2 gas is V. Then in mixture of H_2 and O_2 gas the speed of sound at same temperature:
 - (1) will be less than V.
 - (2) will be more than V
 - (3) will be equal to V
 - (4) nothing can be said
- 28. The velocity of sound in a gas depends
 - (1) only on its wave length
 - (2) on the density and the elasticity of gas
 - (3) on intensity of the sound
 - (4) on the amplitude and the frequency.
- **29.** If at some point the amplitude of the sound becomes double and the frequency becomes one fourth then at that point the intensity of sound will be:-
 - (1) Become double
 - (2) Be half
 - (3) Become one fourth
 - (4) Remain unchanged
- **30.** A sound is produced in water and moves towards surface of water and some sound moves in air velocity of sound in water is 1450 m/s and that in air is 330 m/s. When sound moves from water to air then the effect on frequency f and wave length λ will be:
 - (1) f and λ will remain same
 - (2) f will remain same but λ will increase
 - (3) f will remain same but λ will decrease
 - (4) f will increase and λ will decrease
- **31.** When sound wave travels from air to water, which are of the following remain constant:
 - (1) wavelength

(2) velocity

(3) frequency

(4) intensity

- **32**. Newton's formula for the velocity of sound in gases
 - (1) $v = \sqrt{\frac{2p}{p}}$
- (2) $v = \sqrt{\frac{p}{q}}$
- (3) $v = \sqrt{\frac{\rho}{p}}$
- (4) $v = \frac{3}{2} \sqrt{\frac{p}{p}}$
- **33**. Intensity level of a sound of intensity I is 30 dB. The ratio I/I_0 is

 $(I_0$ is the threshold of hearing)

- $(2)\ 3000$
- (3) 300
- (4) 30
- **34**. If v_m is the velocity of sound in moist air and v_d is the velocity of sound in dry air then:
 - (1) $v_m < v_d$
- (2) $v_m > v_d$
- (3) $v_{d} >> v_{m}$
- (4) $v_m = v_d$
- A sine wave has an amplitude A and wavelength **35**. λ . Let V be wave velocity and v be the maximum velocity of a particle in medium then.
 - (1) V = v if $A = \frac{\lambda}{2\pi}$
 - (2) V can not be equal to v
 - (3) V = v if $\lambda = \frac{3A}{2\pi}$
 - (4) V = v if $A = 2 \pi \lambda$
- A sings with a frequency (n) and B sings with a **36**. frequency 1/8 that of A. If the energy remains the same and the amplitude of A is a, then amplitude of B will be:
 - (1) 2a
- (2) 8a
- (3) 4a
- (4) a
- **37**. The velocities of sound at the same pressure in two monoatomic gases of densities ρ_1 and ρ_2 are v_1 and

 v_2 respectively. If $\frac{\rho_1}{\rho_2}=4$, then the value of $\frac{v_1}{v_2}$

- (1) $\frac{1}{4}$ (2) $\frac{1}{2}$
- (3) 2
- (4) 4
- The time period of SHM of a particle is 12 s. The 38. phase difference between the position at t = 3sand t = 4s will be:
 - (1) $\pi/4$
- (2) $3\pi/5$
- (3) $\pi/6$
- $(4) \pi/2$

- **39**. Velocity of sound in medium is V. If the density of the medium is doubled, what will be the new velocity of sound?
 - (1) $\sqrt{2}V$ (2)V
- (3) $V/\sqrt{2}$
- (4) 2V

REFLECTION OF WAVES AND ECHO

- **40**. A man standing on a cliff claps his hand and hears its echo after one second. If the sound in reflected from another mountain then the distance between the man & reflection points is $V_{\text{sound}} = 340 \text{ m/sec.}$
 - (1) 680 m
- (2) 340 m
- (3) 170 m
- (4) 85 m

PRINCIPLE OF SUPERPOSITION OF WAVES: **INTERFERENCE, BEATS**

- 41. At a particle two simple harmonic motion are acting along the same direction. These are $y_1 = a_1 \sin \omega t$ and $y_2 = a_2 \sin (\omega t + \phi)$. The resultant motion is also a simple harmonic motion whose amplitude will be:
 - (1) $a_1^2 + a_2^2 + 2a_1a_2 \cos \phi$
 - $(2)\sqrt{a_1^2 + a_2^2 + 2a_1a_2\cos\phi}$
 - (3) $\sqrt{a_1^2 + a_2^2 2a_1a_2 \cos \phi}$
 - (4) $a_1^2 + a_2^2 2a_1a_2 \cos \phi$
- **42**. The energy in the superposition of waves:
 - (1) Is lost
 - (2) Increase
 - (3) remain same, only redistribution occurs
 - (4) None of the above
- 43. Waves from two sources superimpose on each other at a particular point. Amplitude and frequency of both the waves are equal. The ratio of intensities when both waves reach in the same phase and they reach with the phase difference of 90° will be
 - (1) 1:1
- (2) $\sqrt{2:1}$
- (3) 2:1
- (4) 4:1
- 44. Two waves whose intensity are same (I) move towards a point P in same phase, then the resultant intensity at point P will be:
 - (1) 4 I
- (2) 2 I
- (3) $\sqrt{2}$ I
- (4) None

- 45. Ratio of amplitudes of two waves is 3:4. The ratio of maximum and minimum intensity obtained from them will be:
 - (1) 7:1

(2) 49:1

(3) 1:25

(4) 5:1

- Two coherent sources of intensities I_1 and I_2 produce an interference pattern, the maximum intensity in the interference patteren will be -
 - $(1) I_1 + I_2$

(2) $I_1^2 + I_2^2$

 $(3) (I_1 + I_2)^2$

(4) $\left(\sqrt{I_1} + \sqrt{I_2}\right)^2$

47 Intensities ratio of two waves are 9:1 then the ratio of their maximum and minimum intensities will be:-

(1) 10 : 8

(2) 7 : 2

(3) 4 : 1

(4) 2 : 1

48. When two tuning forks are sounded together x beats/sec are heard and frequency of A is n. Now when one prong of B is loaded with a little wax, the number of beats per second decreases. The frequency of fork B is :

(1) n + x

(2) n - x

(3) $n - x^2$

(4) n - 2x

49. A source x of unknown frequency produces 8 beats with a source of 250 Hz and 12 beats with a source of 270 Hz. The frequency of source x is :

(1) 258 Hz

(2) 242 Hz

(3) 262 Hz

(4) 282 Hz

Two waves of wave length 2 m and 2.02 m **50**. respectively moving with the same velocity and superimpose to produce 2 beats per sec. The velocity of the waves is:

(1) 400.0 m/s

(2) 402 m/s

(3) 404 m/s

(4) 406 m/s

51. A tuning fork produces 4 beats/sec. with another tuning fork B of frequency 288 Hz. If fork is loaded with little wax no. of beats per sec decreases. The frequency of the fork A, before loading is

(1) 290 Hz

(2) 288 Hz

(3) 292 Hz

(4) 284 Hz

(Column I		Column II
A	Longitudinal waves	P	Particles of the medium vibrate perpendicular to the wave propagation.
В	Transverse waves	Q	Two progressive waves of slightly different frequencies superimpose in the same direction
С	Beats	R	Two progressive waves of same frequency superimpose in the opposite directions
D	Stationary waves	S	Particles of the medium vibrate along the wave propagation.

(1) A-Q, B-R, C-Q, D-P (2) A-S, B-P, C-Q, D-R

(3) A-Q, B-S, C-P, D-R (4) A-P, B-Q, C-S, D-R

What is the path difference for destructive interference?

(1) $n\lambda$

52.

(2) $n(\lambda + 1)$

(3) $\frac{(n+1)\lambda}{2}$

(4) $\frac{(2n+1)\lambda}{2}$

54. When beats are produced by two progressive waves of the same amplitude and of nearly the same frequency, the ratio of maximum intensity to the intensity of one of the waves will be n. Where n is

(1) 3

- (2) 1
- (3)4
- (4) 2
- **55.** The lengths of two closed organ pipes are 0.750 m and 0.770 m. If they are sounded together, 3 beats per second are produced. The velocity of sound will be :-

(1) 350.5 m/sec

(2) 335.5 m/sec

(3) 346.5 m/sec

(4) None of these

56. Two waves having equation

 $x_1 = a \sin(\omega t + \phi_1)$

 $x_2 = a \sin(\omega t + \phi_2)$

If in the resultant wave the frequency and amplitide remains equals to amplitude of superimposing waves. Then phase diff. between them -

(2) $\frac{2\pi}{3}$ (3) $\frac{3\pi}{4}$ (4) $\frac{\pi}{4}$

- **57**. Two sources have frequency 256 Hz and 258 Hz, then time difference between two consecutive maxima is -
 - (1)1 s
- $(2) \ 0.5 \ s$
- (3) 2 ms

(4) None

- 58. Two vibrating tuning forks produce progressive waves given by $Y_1 = 4 \sin 500\pi t$ and $Y_2 = 2 \sin 506 \pi t$. Number of beats produced per minute is:
 - (1) 3
- (2)360
- (3) 180
- (4)60
- **59**. Two plane progressive waves shows destructive interference at point P. Which of the following statement is true at point P:-
 - (1) Crest of one wave is superimposed on crest of another wave
 - (2) Trough of one wave is superimposed on crest of another wave
 - (3) Intensity of resultant wave is equal to the intensity difference of two waves
 - (4) Resultant amplitude is equal to the amplitude sum of two waves

STATIONARY WAVES OR STANDING WAVES **IN STRINGS & ORGAN PIPES**

60. A uniform string of length L and mass M is fixed at both ends under tension T, Then it can vibrate with frequency given by the formula.

(1)
$$f = \frac{1}{2} \sqrt{\frac{T}{MI}}$$

(1)
$$f = \frac{1}{2} \sqrt{\frac{T}{ML}}$$
 (2) $f = \frac{1}{2L} \sqrt{\frac{T}{M}}$

$$(3) f = \frac{1}{2} \sqrt{\frac{T}{M}}$$

(3)
$$f = \frac{1}{2} \sqrt{\frac{T}{M}}$$
 (4) $f = \frac{1}{2} \sqrt{\frac{M}{LT}}$

- 61. The speed of transverse waves in a stretched string is 700 cm/s. If the string is 2 m long, the frequency with which it resonantes in fundamental mode is:
 - (1) (7/2) Hz
- (2) (7/4) Hz
- (3) (14) Hz
- (4) (2/7) Hz
- **62.** With the increase of temperature, the frequency of the organ pipe-
 - (1) increases
 - (2) decreases
 - (3) remains unchanged
 - (4) can not say
- **63.** An empty vessel is partially filled with water the frequency of vibration of air column in the vessel
 - (1) decreases
 - (2) increases
 - (3) depends on the purity of water
 - (4) remains the same

64. A string is rigided by two ends and its equation is given by $y = \cos 2\pi t \sin 2\pi x$

Then minimum length of string is

- (1) 1m
- (2) 1/2m
- (3) 5m
- (4) 2π m
- **65**. A wave represented by the equation y=acos(ωt -kx) is superposed by another wave to form a stationary wave such that the point x = 0 is a node. The equation for other wave is -
 - (1) $y = a \sin(\omega t + kx)$
- (2) $y = -a \cos(\omega t kx)$
- (3) $y = -a \cos(\omega t + kx)$ (4) $y = -a \sin(\omega t kx)$
- A stretched string is vibrating according to the **66**. equation $y = 5 \sin\left(\frac{\pi x}{2}\right) \cos 4\pi t$, where y and a are in cm and t is in sec. The distance between two consecutive nodes on the strings is :-
 - (1) 2 cm
- (2) 4 cm
- (3) 8 cm
- (4) 16 cm
- **67**. The end correction of resonance tube is 1 cm. If lowest resonant length is 15 cm then next resonant length will be :-
 - (1) 36 cm
- (2) 45 cm
- (3) 46 cm
- (4) 47 cm
- If the fundamental frequency for a COP is n, then the next three overtones will have ratio :-
 - (1) 2 : 3 : 4
- $(2) \ 3 : 4 : 5$
- $(3) \ 3 : 7 : 11$
- $(4) \ 3 : 5 : 7$
- **69**. A tube closed at one end and containing air produces, when excited, the fundamental note of frequency 512 Hz. If the tube is open at both ends, the fundamental frequency that can be excited is (in Hz)
 - (1) 1024
- (2)512
- (3)256
- (4) 128
- 70. An air column in pipe, which is closed at one end will be in resonance with a vibrating tuning fork of frequency 264 Hz if the length of the column in cm is : [v = 330 m/s]
 - (1) 31.25
- (2)62.50
- (3) 110
- (4) 125

- 71. Velocity of sound in air is 320 m/s. A pipe closed at one end has a length of 1 m neglecting end corrections, the air column in the pipe can resonant for sound of frequency.
 - (a) 80 Hz
- (b) 240 Hz
- (c) 500 Hz
- (d) 400 Hz

(1) a

- (2) a,b
- (3) a,b,d
- (4) a,d
- **72**. The velocity of sound in air is 330 m/s. The fundamental frequency of an organ pipe open at both ends and of length 0.3 metre will be:
 - (1) 200 Hz
- (2) 550 Hz
- (3) 300 Hz
- (4) 275 Hz
- 73. A hollow metallic tube of length L and closed at one end produce resonance with a tuning fork of frequency n. The entire tube is then heated carefully so that at equilbrium temperature its length changes by ℓ . If the change in velocity V of sound is v, the resonance will now be produced by tuning fork of frequency.
 - (1) $(V + v) / [4(L + \ell)]$ (2) $(V + v) / [4(L \ell)]$

 - (3) $(V v) / [4(L + \ell)]$ (4) $(V v) / [4(L \ell)]$
- **74.** A wave of frequency 100 Hz travels along a string towards its fixed end. When this wave travels back, after reflection, a node is formed at a distance of 10 cm from the fixed end. The speed of the wave (incident and reflected) is:
 - (1) 5 m/s
- (2) 10 m/s
- (3) 20 m/s
- (4) 40 m/s
- **75.** Stationary wave is represented by $Y = A \sin (100 t) \cos (0.01 x)$ where y and A are in mm, t in sec and x in m. The velocity of the wave:
 - (1) 1 m/s
- (2) 10^2 m/s
- $(3) 10^4 \text{ m/s}$
- (4) zero
- **76.** If the tension in a sonometer wire is increased by a factor of four then fundamental frequency of vibration changes by a factor of:
 - (1) 4

(2) (1/4)

(3) 2

(4)(1/2)

- **77**. A sonometer wire, with a suspended mass of M = 1 kg., is in resonance with a given tuning fork. The apparatus is taken to moon where the acceleration due to gravity is 1/6 that of earth. To obtain resonance on the moon, the value of M should be
 - (1) 1 kg.
- (2) $\sqrt{6}$ kg
- (3) 6 kg
- (4) 36 kg
- **78**. Stationary waves are produced in 10m long streched string. If the string vibrates in 5 segments and wave velocity is 20m/sec, then the frequency is-
 - (1) 10 Hz
- (2) 5 Hz
- (3) 4 Hz
- (4) 2Hz
- **79**. A standing wave having 3 nodes and 2 antinodes is formed between 1.21 Å distance then the wavelength is :-
 - (1) 1.21 Å
- (2) 2.42 Å
- (3) 0.605 Å
- (4) 4.84 Å
- **80**. A string under a tension of 129.6 N produces 10 beats/sec when it is vibrated along with a tuning fork. When the tension is the string is increased to 160 N it sounds in unison with same tuning fork. Calculate fundamental freq. of tuning fork.
 - (1) 100 Hz
- (2) 50 Hz
- (3) 150 Hz
- (4) 200 Hz
- 81. If vibrations of a string are to be increased to a factor of two, then tension in the string must be made:
 - (1) half
- (2) thrice
- (3) four times
- (4) eight times
- **82**. An air column having one end closed contains minimum resonance length 50 cm. If it is vibrated by same tuning fork then its next resonance length will be -
 - (1) 250 cm
- (2) 200 cm
- (3) 150 cm
- (4) 100 cm
- **83**. Stationary waves are so called because in them -
 - (1) The particles of the medium are not disturbed at all
 - (2) The particles of the medium do not execute S.H. M.
 - (3) There occur no flow of energy along the wave
 - (4) The interference effect can't be observed

- 84. The maximum length of a closed pipe that would produce a just audible sound is $(V_{sound} = 336 \text{ m/s})$
 - (1) 4.2 cm
- (2) 4.2 m
- (3) 4.2 mm
- (4) 1.0 cm
- **85**. In a sonometer wire, the tension is maintained by suspending a mass M from free end of wire. The fundamental frequency of the wire is N Hz. If the suspended mass is completely immerged in water the fundamental frequency will
 - (1) increases
- (2) constant
- (3) decrease
- (4) can't say
- A second harmonic has to generated in a string of **86**. length ℓ stretched between two rigid supports. The points where the string has to be plucked and touched are -
 - (1) Pluck at $\frac{\ell}{2}$ touch at $\frac{3\ell}{4}$
 - (2) Pluck at $\frac{\ell}{2}$ touch at $\frac{\ell}{4}$
 - (3) Pluck at $\frac{\ell}{4}$ touch at $\frac{3\ell}{4}$
 - (4) Pluck at $\frac{\ell}{4}$ touch at $\frac{\ell}{2}$
- **87.** A wave is represented by the equation $y = a \sin(kx - \omega t)$ is superimposed with another wave to form a stationary wave such that the point x = 0 is a node. Then the equation of other wave
 - (1) $y = a \cos(kx \omega t)$ (2) $y = a \cos(kx + \omega t)$
 - (3) $y = -a\sin(kx + \omega t)$ (4) $y = a\sin(kx + \omega t)$
- 88. If the air column in a pipe which is closed at one end, is in resonance with a vibrating tuning fork of frequency 260 Hz, then the length of the air column is:
 - (1) 35.7 cm
- (2) 31.7 cm
- (3) 12.5 cm
- (4) 62.5 cm
- If the tension and diameter of a sonometer wire of fundamental frequency (n) is doubled and density is halved then its fundamental frequency will become :-
 - (1) $\frac{n}{4}$

(2) $\sqrt{2}$ n

(3) n

(4) $\frac{n}{\sqrt{2}}$

- 90. The tension in a piano wire is 10N. What should be the tension in the wire to produce a note of double the frequency?
 - (1) 10N
- (2) 20N
- (3) 40N
- (4) 80N
- 91. A sound wave of frquency 330Hz is incident normally at reflected wall then minimum distance from wall at which partical vibrate very much :- $(V_{sound} = 330 \text{ m/s})$
 - (1) 0.25 m
- (2) 0.125 m
- (3) 1 m
- (4) 0.5 m
- An open organ pipe of length 33 cm, vibrates with frequency 1000 Hz. If velocity of sound is 330 m/s, then its frequency is:-
 - (1) Fundamental frequency
 - (2) First overtone of pipe
 - (3) Second overtone
 - (4) Fourth overtone
- 93. Fundamental frequency of sonometer wire is n. If the length, tension and diameter of wire are tripled. the new fundamental frequency is :-
 - (1) $n/\sqrt{3}$
- (3) $n\sqrt{3}$
- (4) $n/3\sqrt{3}$
- 94. A string in a musical instrument is 50 cm long and its fundamental frequency is 800 Hz. If a frequency of 1000 Hz is to be produced, then required length of string is:
 - (1) 62.5 cm
- (2) 50 cm
- (3) 40 cm
- (4) 37.5
- **95**. Four wires of identical lengths, diameters and of the same material are stretched on a sonometer wire. The ratio of their tension is 1:4:9:16. The ratio of their fundamental frequencies is
 - (1) 1 : 2 : 3 : 4
- (2) 16 : 9 : 4 : 1
- (3) 1 : 4 : 9 : 16
- $(4) \ 4 : 3 : 2 : 1$
- 96. Given equation is related to

$$y = \cos\left(\frac{2\pi}{\lambda}x\right) \cos(2\pi vt)$$

- (1) Transverse progressive
- (2) Longitudinal progressive
- (3) Longitudinal stationary wave
- (4) Transverse stationary wave

- **97.** If V is the speed of sound in air then the shortest length of the closed pipe which resonants to a frequency n:
- (1) $\frac{V}{2n}$ (2) $\frac{V}{4n}$ (3) $\frac{4n}{V}$ (4) $\frac{2n}{V}$
- 98. A stretched string is 1 m long. Its mass per unit length is 0.5 g/m. It is stretched with a force of 20 N. It plucked at a distance of 25 cm from one end. The frequency of note emitted by it will be:
 - (1) 400 Hz
- (2) 300 Hz
- (3) 200 Hz
- (4) 100 Hz
- 99. What is the beat frequency produced when following two waves are sounded together?
 - $x_1 = 10 \sin (404\pi t 5\pi x),$
 - $x_2 = 10 \sin (400\pi t 5\pi x).$
 - (1) 4
- (2) 1
- (4) 2
- **100.** What is minimum length of a tube, open at both ends, that resonates with tuning fork of frequency 350 Hz? (velocity of sound in air = 350 m/s) (1) 50 cm (2) 100 cm (3) 75 cm (4) 25 cm
- **101.** An underwater sonar source operating at a frequency of 60 kHz directs its beam towards the surface. If velocity of sound in air is 330 m/s, wavelength and frequency of the waves in air are:-
 - (1) 5.5 mm, 60 kHz
- (2) 3.30 m, 60kHz
- (3) 5.5 mm, 30 kHz
- (4) 5.5 mm, 80 kHz
- **102.** An organ pipe closed at one end has fundamental frequency of 1500 Hz. The maximum number of overtones generated by this pipe which a normal person can hear is
 - (1) 14
- (2) 13
- (3) 6
- (4)9
- 103. Length of the close organ pipe is 1 m. At which frequency resonance will not occur (v = 320 m/sec.) (1) 80 Hz (2) 240 Hz (3) 300 Hz (4) 400 Hz
- **104.** A 10 cm long organ pipe is open at one end and closed at other end. What is the maximum wavelength of wave produced by it :-
 - (1) 40cm
- (2) 20cm
- (3) 10cm
- (4) 5cm
- **105.** An open resonating tube has fundamental frequency of n. When half of its length is dipped into water, then its fundamental frequency will be:
 - (1) n
- (2) n/2
- (3) 2n
- (4) 3/2 n.

- **106.** A pipe is closed from one end and open from another end then which statement is true?
 - (1) Node is formed slightly above the open end.
 - (2) Node is formed slightly below the open end.
 - (3) Antinode is formed slightly above the open end.
 - (4) Antinode formed slightly below the open end.

DOPPLER EFFECT IN SOUND WAVES AND **LIGHT WAVES**

- **107.** The apparent change in the pitch of sound due to relative motion between observer and the source is called:
 - (1) Doppler's effect
- (2) Resonance of waves
- (3) interference
- (4) none of the above
- 108. A siren blown in workshop emits waves of frequency 1000 Hz. A car driver approaches the workshop with velocity 90 km/hour then frequency of sound heard by driver will be in Hz. ($V_{sound} = 330 \text{ m/s}$) $(3)\ 1176$ (1)926(2) 1076
- **109.** A star is continuously moving away from us than the wavelength coming from star on the earth:
 - (1) Will shift towards violet colour
 - (2) Will shift towards red colour.
 - (3) remain unchanged
 - (4) Will shift sometimes towards violet and some other time it will shift towards red colour.
- **110.** A source of frequency 200 Hz is moving towards an observer with a velocity equal to the sound velocity V. If observer also moves away from the source with same velocity then apparent frequency heard by observer will be:
 - (1) 50 Hz
- (2) 160 Hz
- (3) 150 Hz
- (4) 200 Hz
- 111. Doppler's effect in the form of frequency doesn't depend upon:
 - (1) Frequency produced by waves
 - (2) Velocity of source
 - (3) Velocity of observer.
 - (4) Separation between source & observer.
- 112. The wavelength of the light received from a galaxy is 0.4% greater than the wave length on the earth then the velocity of galaxy relative to the earth will be:
 - (1) $1.2 \times 10^7 \text{ m/sec}$
- (2) 1.2 x 10⁶ m/sec
- (3) 1.2 x 10⁵ m/sec
- (4) 1.2 x 10⁴ m/sec

- **113.** The term "Red shift" referring to doppler's effect for light repersent which of following property:
 - (1) decrease in frequency
 - (2) increase in frequency
 - (3) decrease in intensity
 - (4) Increase in intensity
- 114. A source and an observer moves away from each other, with a velocity of 15 m/sec with respect to ground. If observer finds the frequency of sound coming from source as 1950 Hz. Then actual frequency of source will be (velocity of sound = 340 m/sec.) :

- (1) 1785 Hz
- (2) 1968 Hz
- (3) 1950 Hz
- (4) 2130 Hz
- 115. A source of sound of frequency n and a listener approach each other with a velocity equal to $\frac{1}{20}$ of velocity of sound. The apparent frequency heard by the listener is:

$$\text{(1) } \left(\frac{21}{19}\right) \! n \quad \text{(2) } \left(\frac{20}{21}\right) \! n \quad \text{(3) } \left(\frac{21}{20}\right) \! n \quad \text{(4) } \left(\frac{19}{20}\right) \! n$$

- **116.** A source of sound of frequency 1000 Hz is moving with a uniform velocity 20 m/s. The ratio of apparent frequency heard by the observer before and after the source crosses him would be: [v = 340 m/s]
 - (1) 9 : 8
- (2) 8:9
- (3) 1:1
- (4) 9:10
- **117.** Two sound sources (of same frequency) are placed at distance of 100 meter. An observer, when moving between both sources, hears 4 beats per second. The distance between sound source is now changed to 400 meter then the beats/second heard by observer will be:
 - (1) 2
- (2) 4
- (3) 8
- (4) 16
- 118. Doppler effect for sound depends upon the relative motion of source and listener and it also depends upon that which one of these is in motion. Whereas in doppler effect for light it only depends upon the relative motion of the source of light and observer. The reason for it is :
 - (1) Einstein's mass energy relation
 - (2) Einstein's theory of relativity
 - (3) Photo electric effect
 - (4) none of above

- **119.** A source of sound of frequency 500 Hz is moving towards an observer with velocity 30 m/s. The speed of sound is 330 m/s. The frequency heard by the observer will be:
 - (1) 550 Hz
- (2) 458.3 Hz
- (3) 530 Hz
- (4) 545.5 Hz
- **120.** A bus is moving with a velocity of 5 m/s towards a huge wall. The driver sounds a horn of frequency 165Hz. If the speed of sound in air is 335 m/s, No. of beats heared by a passenger on bus will be-
 - (1)6
- (2)5
- (3) 3
- (4) 4
- **121.** A sound source is going away from an observer with the sound speed. The apparent frequency which the observer listen
 - (1) will be half
 - (2) will remains same
 - (3) will be double
 - (4) will not be observed
- **122.** The wavelength of a distant star is 5700 A° and the spectral light has a shift of 1.9 A° towards red end then the velocity of star relative to the earth will be:
 - (1) $5 \times 10^5 \text{ m/sec}$
- (2) 2 x 10⁵ m/sec
- (3) 1.8 x 10⁵ m/sec
- (4) 1 x 10⁵ m/sec.
- **123.** Two trains A and B are moving in the same direction with velocities 30 m/s and 10 m/s respectively. B is behind from A and A blows a horn of frequency 450 Hz. Then the apparent frequency heard by observer on train B is (speed of sound is 330 m/s):
 - (1) 425 Hz
- (2) 300 Hz
- (3) 450 Hz
- (4) 350 Hz
- **124.** If a star emitting light of wavelength 5000 Å is moving towards earth with a velocity of 1.5×10^6 m/s then the shift in the wavelength due to Doppler's effect will be:
 - (1) 2.5 Å
- (2) 250 Å
- (3) 25 Å
- (4) Zero
- **125**. Two stationary sources each emitting waves of wave length λ . An observer moves from one source to other with velocity u. Then number of beats heared by him:-
 - (1) $\frac{2u}{\lambda}$ (2) $\frac{u}{\lambda}$ (3) $\sqrt{u\lambda}$ (4) $\frac{u}{2\lambda}$

- **126.** A vehicle, with a horn of frequency n is moving with a velocity of 30 m/s in a direction perpendicular to the straight line joining the observer and the vehicle. The observer perceives the sound to have a frequency $n + n_1$. Then: (Take velocity of sound in air 330 m/s):
 - (1) $n_1 = 10 \text{ n}$
- (2) $n_1 = -n$
- (3) $n_1 = 0$
- (4) $n_1 = 2n$
- **127.** Doppler effect for light differs from that for sound in regards that :
 - (1) the relative frequency shift is smaller for light than for sound.
 - (2) the velocity addition valid for sound is not true for light waves.
 - (3) velocity of light is very large as compared to sound.
 - (4) light waves are electromagnetic waves but sound waves are mechanical.
- **128.** If a source is moving away from a stationary observer with half of velocity of sound. The frequency observed will be :-
 - (1) one-third
- (2) doubled
- (3) halved
- (4) two-third

- **129.** A siren emitting sound of frequency 800 Hz is going away, from a static listener, with a speed of 30 m/s. Frequency of sound to be heared by the listener is : (Velocity of sound = 330 m/s):-
 - (1) 286.5 Hz
- (2) 481.2 Hz
- (3) 733.3 Hz
- (4) 644.8 Hz
- **130.** As temperature increase, difference between apparent doppler frequency and actual frequency
 - (1) Decreases
 - (2) Remains unchanged
 - (3) Increases
 - (4) Depending on frequency, increase or decrease.
- 131. An observer moves towards a stationary source of sound with a speed 1/5th of the speed of sound. The wavelength and frequency of the source are λ and f respectively. The apparent frequency and wavelength recorded by the observer are respectively:—
 - (1) 1.2f, 1.2λ
- (2) 1.2f, λ
- (3) f, 1.2λ
- (4) 0.8f, 0.8λ
- **132.** Velocity of star is 10^6 m/s and frequency of emitted light is 4.5×10^{14} Hz. If star is moving away, then apparent frequency will be :
 - (1) 4.5 Hz.
- (2) 4.5×10^{16} Hz.
- (3) 4.485×10^{14} Hz.
- (4) 4.5×10^8 Hz.

EXERCISE-II (Assertion & Reason)

Directions for Assertion & Reason questions

These questions consist of two statements each, printed as Assertion and Reason. While answering these Questions you are required to choose any one of the following four responses.

- (A) If both Assertion & Reason are True & the Reason is a correct explanation of the Assertion.
- (B) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.
- **(C)** If Assertion is True but the Reason is False.
- (D) If both Assertion & Reason are false.
- 1. **Assertion**: In standing wave pattern particle of medium between two consecutive nodes vibrates in same phase but with different amplitude.

Reason: In stationary wave, the amplitude of vibration does not depends on the position of the particle.

(1) A(2) B(3) C(4) D

2. **Assertion**: The velocity of sound in air decreases if the pressure of air decreases at constant temperature.

> **Reason**: According to Laplace's formula as modified by Newton, velocity of sound in air is given

by
$$V = \sqrt{\frac{\gamma P}{\rho}}$$
.

(1) A (2) B(3) C(4) D

3. **Assertion**: The wave function of a pulse is given

by
$$y = \frac{3}{(2x+3t)^2+4}$$
, it propagates in (-ve)

Reason: The given wave function is of the form $y = f(kx + \omega t)$. which represent a wave travelling in negative X-direction.

(1) A (2) B

(3) C(4) D Assertion: Longitudinal waves are called

pressure waves. **Reason**: Propagation of longitudinal waves through a medium involves changes in pressure (density of medium particles), when compressions and rarefactions are formed.

(1) A

4.

(2) B

(3) C

(4) D

5. **Assertion:** Mechanical transverse waves cannot be generated in gaseous medium.

> Reason: Mechanical transverse waves can be produced only in such medium which have shearing property.

(1) A

(2) B

(3) C

(4) D

6. **Assertion**: If three sources of sound of equal intensities with frequency n, n+1 and n+2 Hz are sounded simultaneously, the beat frequency heard is **2**.

Reason: In beats at a given position, intensity varies periodically with time with periodicity $T = 1/(n_1 \sim n_2)$ while in interference at a given time, intensity varies periodically with position with periodicity λ .

(1) A

(2) B

(3) C

(4) D

7. **Assertion**: In transverse wave particle velocity is perpendicular to the direction of wave velocity.

> **Reason**: In wave motion energy is always transfered in the direction of wave propagation.

(1) A

(2) B

(3) C

(4) D

8. **Assertion**: In longitudinal wave propagation the distance between two consecutive compression is equal to wavelength of wave.

Reason: Standing wave does not get transfered.

(1) A

(2) B

(3) C

9. Assertion: Sound wave travels faster in moist air. **Reason**: The density of moist air is less then density of dry air.

(1) A

(2) B

(3) C

(4) D

Assertion: Standing wave does not transfere energy in the medium.

> **Reason**: Every particle vibrates with its own energy and it does not share its energy with any other particle.

(1) A

(4) D

(2) B(3) C **Assertion**: When two vibrating tuning forks 11. having frequencies 240 Hz and 300 Hz are held near each other, beats cannot be heard by us

Reason: This is because beats cannot be distinctly heard due to the property of persistence of hearing.

(1) A

(2) B

(3) C

12. **Assertion**: Harmonics are the notes (a single sound of a certain pitch & wavelength) of frequencies which are integral multiple of the fundamental frequency.

> **Reason**: Tones of freguncies higher than fundamental note are called overtones.

22.

on a liquid surface.

Assertion: Partially transverse waves are possible

Reason: Surface tension provide some rigidity on

13. *Assertion*: Due to end correction fundamental

without end correction.

frequency of any pipe becomes less than frequency

31. Assertion: Vacuum is densest for sound and rarest for light.

Reason: A medium is said to be denser, when velocity of waves through this medium is smaller.

- (1) A
- (2) B
- (3) C
- (4) D
- **32.** Assertion: Transverse waves can travel in all medium.

Reason: All the gases have some bulk modulus.

- (1) A
- (2) B
- (3) C
- (4) D
- **33. Assertion**: When a wave is generated in an ideal string, in a non dispersive medium, energy does not change significantly.

Reason: Velocity of the wave generated on the string depends upon the tension applied.

- (1) A
- (2) B
- (3) C
- (4) D
- **34. Assertion**:-When a stone is dropped in water the amplitude of progressive wave decreases with distance

Reason: Amplitude of spherical wavefront is inversely proportional to radius.

- (1) A
- (2) B
- (3) C
- (4) D
- **35. Assertion:** Water waves in a lake can not be polarised. [AIIMS 2018]

Reason: These waves are longitudinal in nature.

- (1) A
- (2) B
- (3) C
- (4) D

36. Assertion: In a medium group velocity is greater than phase velocity. **[AIIMS 2018]**

Reason :-
$$\frac{dv}{d\lambda}$$
 is +ve.

- (1) A
- (2) B
- (3) C
- (4) D
- **37. Assertion**: In a string wave, during reflection from fixed end, the reflected wave is inverted.

Reason: The force on string by clamp is in downward direction while string is pulling the clamp in upward direction.

[AIIMS 2018]

- (1) A
- (2) B
- (3) C
- (4) D
- **38. Assertion**:- If a wave pulse propagating on a string is reflected from free end then it is not inverted.

Reason :- Transverse force is absent and medium is discontinuous at free end. [AIIMS 2018]

- (1) A
- (2) B
- (3) C
- (4) D
- **39.** Assertion: Sound wave propagation in form of compressions and rarefactions is an adiabatic process. [AIIMS 2018]

Reason:- Air is a bad conductor of heat.

- (1) A
- (2) B
- (3) C
- (4) D
